■ Introduction

This guide provides reference information for creating NA screens but no safety information.
Be sure to obtain the manuals for NA Series Programmable Terminal, read and understand the safety points and other information required for use, and test sufficiently before actual use of the equipment.

Terms and Conditions Agreement

Thank you for your usage of products of Omron Corporation (“Omron”). Without any special agreements, these terms and conditions shall apply to all transactions regardless of who sells.

● Definitions of Terms

Omron product(s): Omron’s factory automation system devices, general control devices, sensing devices, and electronic/mechanical components.

- Catalogs: Any and all catalogs (including “Best Components” and other catalogs), specifications, instructions and manuals relating to Omron products, including electronically provided data.
- Conditions: Use conditions, rating, performance, operating environment, handling procedure, precautions and/or prohibited use of Omron products described in the catalogs.
- User application(s): Application of Omron products by a customer, including but not limited to embedding/using Omron products into customer’s components, electronic circuit boards, devices, equipment or systems.
- Conformity: (a) conformity, (b)performance, (c) no infringement of intellectual property of third party, (d) compliance with laws and regulations, and (e) conformity to various standards of Omron products in user applications.

● Note about Descriptions

- Rating and performance is tested separately. Combined conditions are not warranted.
- Reference data is intended to be used just for reference. Omron does NOT guarantee that the Omron Product can work properly in the range of reference data.
- Examples are intended for reference. Omron does not warrant the conformity in usage of the examples.
- Omron may discontinue Omron products or change specifications of them because of improvements or other reasons.

● Note about Use

Adopt and use Omron products considering the following cautions.

- Use the product in conformance to the conditions, including rating and performance.
- Check the conformity and decide whether or not Omron products are able to be adopted. Omron makes no guarantees about the conformity.
- Make sure in advance that electricity is properly supplied to Omron products and they are set up rightly in your system for intended use.
- When you use Omron products, ensure the followings: (i) allowance in aspect of rating and performance, (ii) safety design which can minimize danger of the application when the product does not work properly, (iii) systematic safety measures to notify danger to users, and (ⅳ) periodical maintenance of Omron products and the user application.
- Omron assumes no responsibility for any direct or indirect loss, damage and expense resulting from infection of our products, installed software, any computer devices, computer programs, network, and databases with the followings: DDoS attack (distributed

DoS attack); computer virus and other technically harmful program; and unauthorized access.
Please conduct the followings by yourself: (i) antivirus software, (ii) data input/output, (iii) lost data recovery, (ⅳ) protections against computer virus that contaminate Omron products or the installed software, and (ⅴ) measures to protect Omron products from unauthorized access.

- Omron products are designed and manufactured as commodity for general industrial products. For this reason, the usages (a) to (d) are to be unintended. Omron makes no guarantees on Omron products, if you use Omron products for those purposes. However, special applications that Omron expects or usages with especial agreement are excluded.
  (a) Applications requiring high-level safety (e.g., nuclear control facilities, combustion facilities, aerospace and aviation facilities, railroad facilities, elevating facilities, amusement facilities, medical facilities, safety devices or other applications which has possibility to influence lives or bodies)
  (b) Applications requiring high reliability (e.g., gas/water/electricity supply system, 24-hour operating system, applications handling with rights/property, such as payment system)
  (c) Applications in a harsh condition or environment (e.g., outdoor facilities, facilities with potential of chemical contamination or electromagnetic interference, facilities with vibration or impact, facilities on continual operation for a long period).
  (d) Applications under conditions or environment which are not described in the catalogs
- Omron products in the catalogs are not intended to be used in automotive applications (including two-wheel vehicles). Please DO NOT use Omron products in automotive applications. Contact our sales personnel for automotive products.

● Warranty

Warranty of Omron products is subject to followings.

- Warranty Period: One year after your purchase.
  However, except when there is a separate statement in the catalogs.
- Coverage: Omron will provide one of the services listed below, on the basis of Omron's decision.
  (a) Free repairing of the malfunctioning Omron products (except electronic/mechanical components) at Omron maintenance service sites.
  (b) Free replacement of the malfunctioning Omron products with the same number of substitutes.
- Exceptions: This warranty does not cover malfunctions caused by any of the followings.
  (a) Usage in the manner other than its original purpose
  (b) Usage out of the conditions
  (c) Usage out of Note about Use in these conditions
  (d) Remodeling/repairing by anyone except Omron
  (e) Software program by anyone except Omron
  (f) Causes which could not be foreseen by the level of science and technology at the time of shipment of the products.
  (g) Causes outside Omron or Omron products, including force majeure such as disasters

● Limitation of Liability

The warranty described in this Terms and Conditions Agreements is a whole and sole liability for Omron products. There are no other warranties, expressed or implied.
Omron and its distributors are not liable for any damages arisen from or relating to Omron products.

● Export Control

Customers of Omron products shall comply with all applicable laws and regulations of other relevant countries regarding security export control, in exporting Omron products and/or technical documents or in providing such products and/or documents to a non-resident.
Omron products and/or technical documents may not be provided to customers if they violate the laws and regulations.

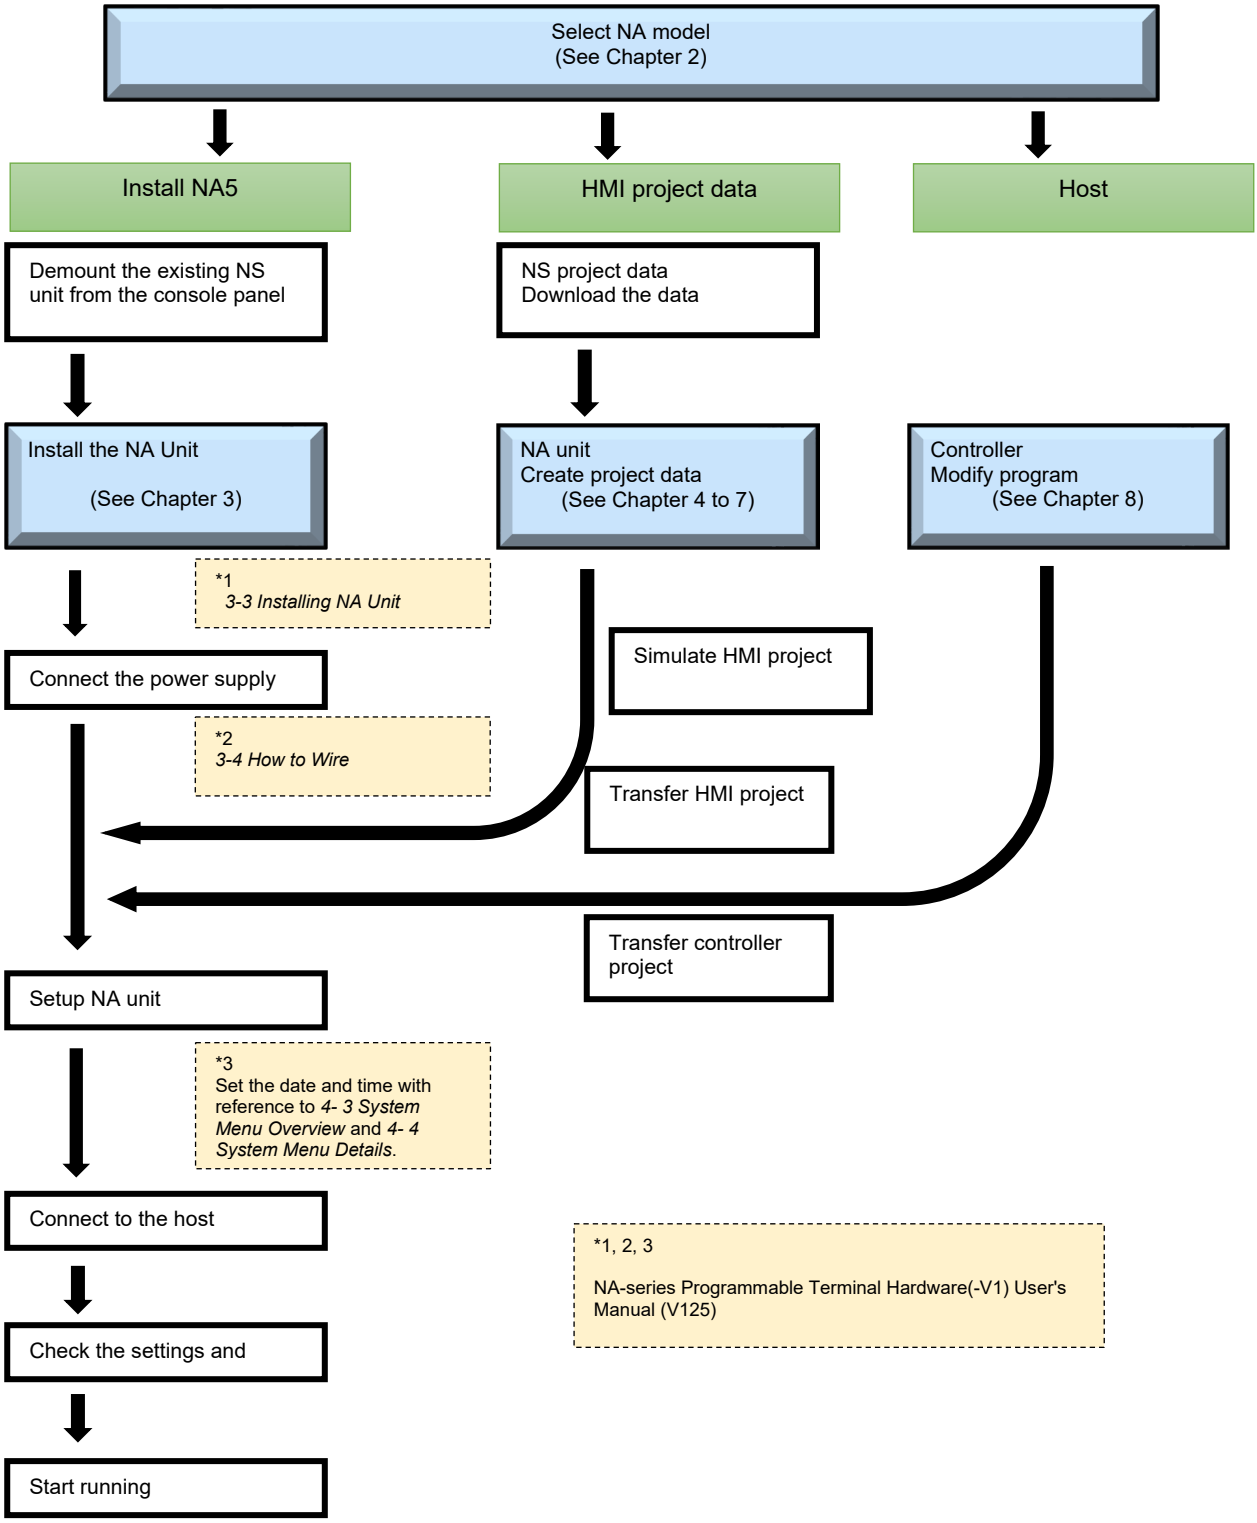
1 How to Replace NS to NA5

The following diagram illustrates the procedure for replacing an NS series unit to an NA series unit.



2 Select NA Model

2-1 Communication Protocols and External Devices

The table below shows communication protocols and host configurations for a NA system, which depending on the unit model and communication protocol in your NS system.
Refer to “NA-series Programmable Terminal Device Connection User's Manual” (V119) for available PLCs for each communication protocol.

<table>
<tr><th rowspan="2">NS port</th><th colspan="3">NS host configuration</th><th colspan="2">Change in host configuration for NA</th></tr>
<tr><th colspan="2">Connect to</th><th>Protocol</th><th>Protocol</th><th>What to do with host unit</th></tr>

<tr><td>Video input
RGB input</td><td colspan="2">Video camera and other video equipment</td><td>--</td></tr>
</table>

The table below shows communication protocols and host configurations for a Soft-NA and NA system, which depending on the unit model and communication protocol in your NS-Runtime. Refer to “NA-series Programmable Terminal Device Connection User's Manual” (V119) for available PLCs for each communication protocol.

Replacing NS-Runtime with Soft-NA

NS-Runtime port	NS-Runtime host configuration			Change in host configuration for Soft-NA	
	Connect to		Protocol	Connect to	What to do with host unit
Ethernet	OMRON PLC	CV series	FINS	N/A	The Soft-NA does not support to connect CS, CJ, CP and CV series. It is necessary to replace the PLC with the NJ/NX series. and please consider replacing it with an Ethernet connection.
		CS1/CJ1/CP1 Series	FINS		
			EtherNet/IP		
		CJ2 Series	FINS		
			EtherNet/IP		
Serial port A/B	OMRON PLC		Host Link	N/A	The Soft-NA does not support Serial Communication. It is necessary to replace the PLC with the NJ/NX series. and please consider replacing it with an Ethernet connection.
			Tool Bus		
Controller Link	Controller Link device			N/A	The Soft-NA does not support Controller Link device. It is necessary to replace the PLC with the NJ/NX series. and please consider replacing it with an Ethernet connection.

Replacing NS-Runtime with NA series units

NS-Runtime port	NS-Runtime host configuration			Change in host configuration for NA series units	
	Connect to		Protocol	Connect to	What to do with host unit
Ethernet	OMRON PLC	CV Series	FINS	N/A	Replacement of the PLC is recommended.
		CS1/CJ1/CP1 Series	FINS	FINS Ethernet	Modification of the host configuration is not necessary. Note: Only the automatic address generation is available in the FINS Ethernet connection for the NA series units. If you have set the manual addressing or the IP address table, reset to the IP address corresponding to the automatic address generation or choose CIP Ether.
			EtherNet/IP	CIP Ethernet	
		CJ2 Series	FINS	FINS Ethernet	
			EtherNet/IP	CIP Ethernet	
Serial port A/B	OMRON PLC	CV Series	Host Link	N/A	Replacement of the PLC is recommended.
		CS1/CJ1/CP1 Series	Host Link	Host Link	For the CJ, CS, and CP series, the NA series units support only Host Link. Select Host Link for the PLC serial port if you have set the previous connection method to Tool Bus.
			Tool Bus		
		CJ2 Series	Tool Bus		
Controller Link	Controller Link device			N/A	The Soft-NA does not support Controller Link device. It is necessary to replace the PLC with the NJ/NX series. and please consider replacing it with an Ethernet connection.

2-2 Display Size

Select an NA series unit according to the display size of your NS unit.
NS series units are equipped with 4:3 displays, but NA series units are equipped with 16:10 wide-type displays. An NA5 that has “W” in its model number is the wide display type.

However, replacing with the following NA series does not allow us to utilize the panel cuts of the NS series as they are. Therefore, we have prepared attachments to utilize the panel cuts of the NS series as they are.
The attachment can be used to replace it with the NA series, which is one step smaller in inch size.
For details on panel cutting and attachment, please refer to Section 3-1.

NS Units to be Replaced				Recommended NA5 Units		
	Display Size	Resolution (Dots)			Panel size	Resolution (dot)
NS15	15.0 inches	1024 x 768	→	NA5-15W□□□□-V1(-P)	15.4 W	1280 x 800
NS12	12.1”	800 x 600	→	NA5-12W□□□□-V1(-P)	12.1 W	1280 x 800
NS10	10.4”	640 x 480				
NS8	8.1”	640 x 480	→	NA5-9W□□□□-V1(-P)	9.0 W	800 x 480
NS5	5.7”	320 x 240	→	NA5-7W□□□□-V1(-P)	7.0 W	800 x 480

2-3 SD Card (or USB Stick Memory)

The data logging function in the NA series stores the collected log data to an SD card or USB stick memory. Therefore, an SD card or USB stick memory must be mounted on the NA unit during the operation.

Note that you cannot use a USB stick memory in a high-vibrational environment. Also, the NA-series units are not equipped with a feature to fix the mounted stick memory. We recommend the SD card to store a long-time log data.

You need to consider the room for inserting and ejecting the SD card when installing an NA unit.

3 Install the NA Unit

Refer to “3-3 Installing NA Units” in “Programmable Terminal NA Series Hardware (-V1) User’s Manual” (V125) for details.

3-1 Panel cutout

3-1-1 Differences in Front Size and Panel Cutout Dimensions

The following is a comparison table of NS series and NA series.

(Units: mm)

NS				NA5			
NS	Thickness	Front dimensions	Panel cutout	NA5	Thicknes s	Front dimensions	Panel cutout
NS15	75.8	405 x 304	383.5 x 282.5	NA5-15W□□□□-V1(-P)	69	420 x 291	(392 + 1.0) x (268 + 1.0)
NS12	48.5	315 x 241	302 x 228	NA5-12W□□□□-V1(-P)		340 x 244	(310 + 1.0) x (221 + 1.0)
NS10							
NS8		232 x 177	220.5 x 165.5	NA5-9W□□□□-V1(-P)		290 x 190	(261 + 1.0) x (166 + 1.0)
NS5	54.0	195 x 142	184 x 131	NA5-7W□□□□-V1(-P)		236 x 165	(197 + +0.5) x (141 + +0.5)

3-1-2 Differences of Panel Cutout

If the larger panel cutout size is necessary, you must enlarge the window in your control panel. Replacement from an NS15, NS12, or NS10 unit will leave a gap in height, which requires an adjustment plate. We do not provide dedicated plates because any replacements require widening the panel cutout. Please prepare one for yourself.

NS15 To NA5-15W□□□□-V1(-P)

A 14 mm gap in height

Cut the width by 9 mm

NS12/ NS10 To NA5-12W□□□□-V1(-P)

A 7 mm gap in height

Cut the width by 8 mm

NS8	To NA5-9W□□□□-V1(-P)	 Cut the width by 41 mm	Heights are the same
NS5	To NA5-7W□□□□-V1(-P)	 Cut the width by 13 mm	Cut the height by 10 mm

3-1-3 Differences of Front Size

Increase in the front size may cause an interference with devices around the panel.
Dedicated attachments are available for replacement in specific combinations. For details, please refer to “3-1-4 Attachments.”

For replacement combinations not covered, customers are requested to make their own arrangements.

NS	NA5	Changes in front size	
		Width	Height
NS15	NA5-15W□□□□-V1(-P)	+20	-14
NS12	NA5-12W□□□□-V1(-P)	+25	+3
NS10			
NS8	NA5-9W□□□□-V1(-P)	+58	+13
	NA5-7W□□□□-V1(-P)	+4	-12
NS5	NA5-7W□□□□-V1(-P)	+41	+23

3-1-4 Attachments

To make use of the existing NS Series panel cutout, the following attachments are available.
In this case, an NA series unit one size smaller is used and mounted on the attachment.

Model	Dimensions
NA-12WATT01	NA-9WATT01	NA-7WATT01	
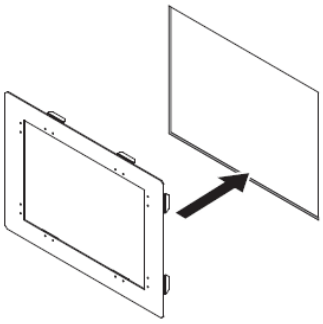
The attachments are applicable to the replacement combinations listed in the table below.

NS	NA	Attachment
NS15	NA5-12W□□□□-V1(-P)	NA-12WATT01
NS12	NA5-9W□□□□-V1(-P)	NA-9WATT01
NS10		
NS8	NA5-7W□□□□-V1(-P)	NA-7WATT01

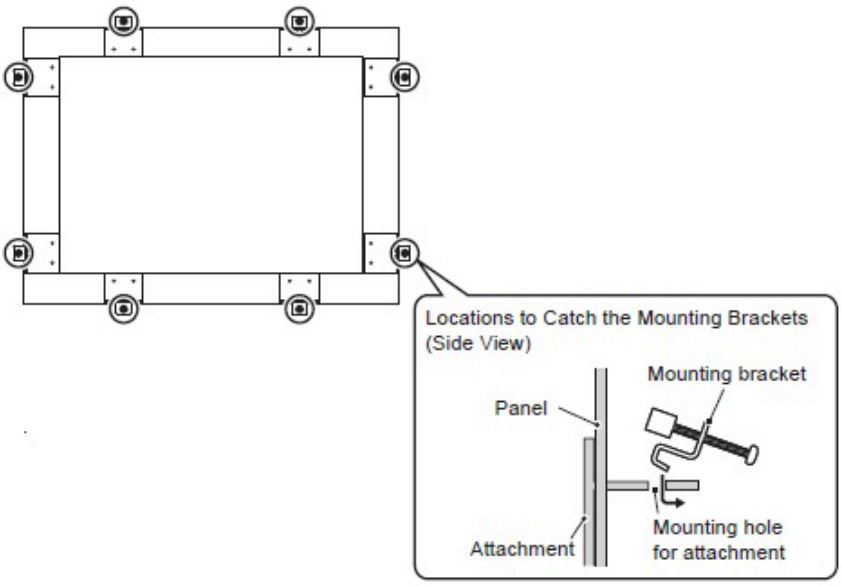
The procedure for mounting the attachment is as follows.

1. Fit the attachment into the recessed holes designed for the NS, and secure the attachment and the panel using the mounting brackets supplied. (Tightening torque: 0.5 to 0.6 N・m)

・Front

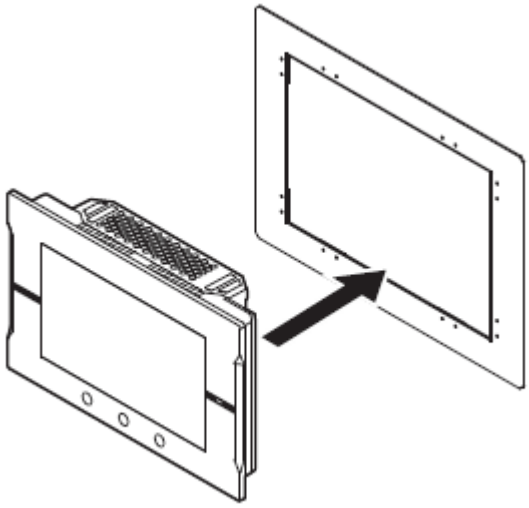


・Rear



2. Insert the NA from the front of the attachment, and secure it using the mounting brackets supplied with the NA.
The positions of the mounting brackets are the same as when the attachment is not used.
Please refer to the “NA-series Programmable Terminal Hardware (-V1) User’s Manual”.

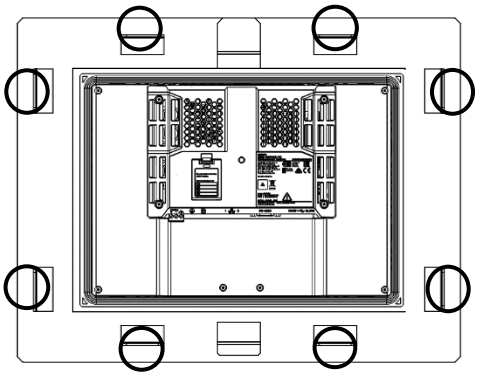
・Front



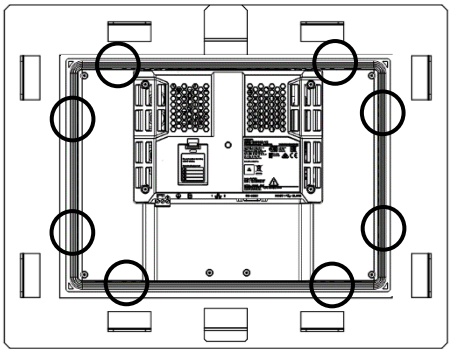
3. The mounting position of the control panel when viewed from the rear varies depending on the model, as follows.

NA5-12W□□□□-V1(-P)

NA-12WATT01
Mounting brackets: 8 locations

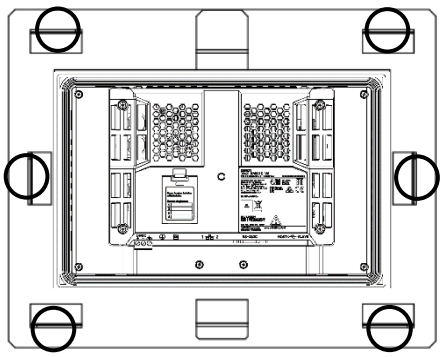


NA5-12W□□□□-V1/V1-P
Mounting brackets: 8 locations

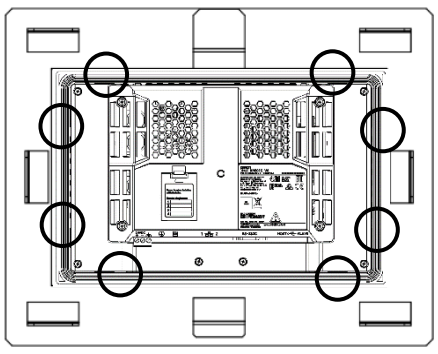


NA5-9W□□□□-V1(-P)

NA-9WATT01
Mounting brackets: 6 locations

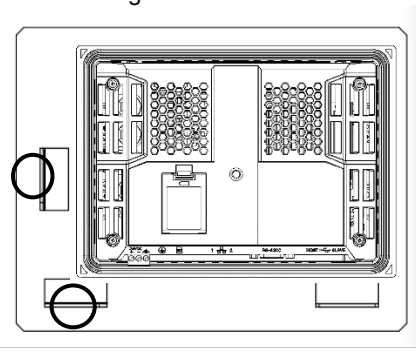


NA5-9W□□□□-V1/V1-P
Mounting brackets: 8 locations

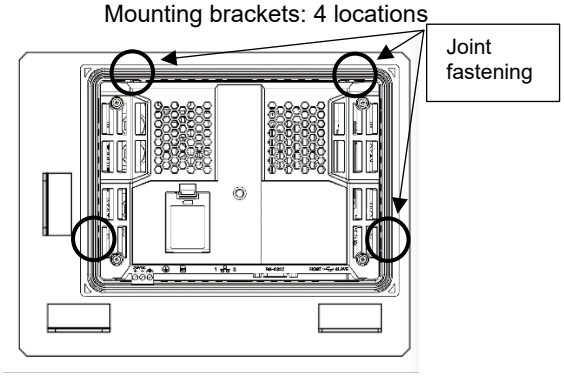


NA5-7W□□□□-V1(-P)

NA-7WATT01
Mounting brackets: 2 locations



形 NA5-7W□□□□-V1/V1-P
Mounting brackets: 4 locations



3-2 Precautions for Connecting to a Power Source

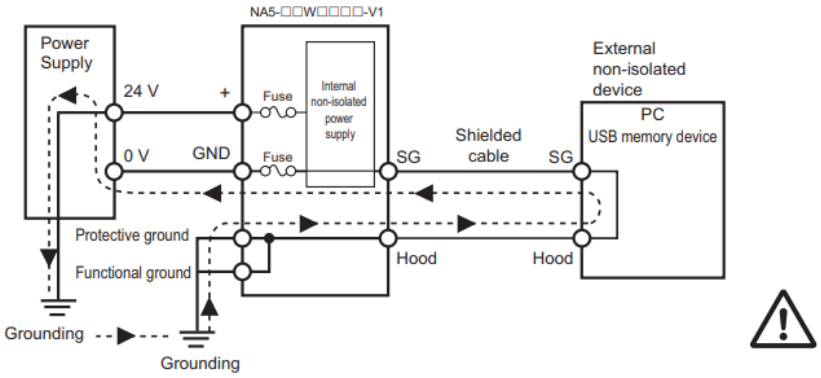
3-2-1 Differences in Power Circuit

The internal power supply of the NS series units is an isolated circuit, but in the NA series units, internal power supply is a non-isolated DC power supply.

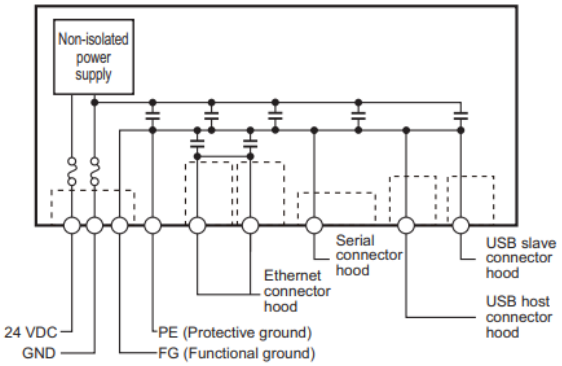
⚠ WARNING

Replacing an NS unit that is positively grounded to 24 V supply power with an NA unit as is will cause a short circuit and damage the device, as illustrated below. Ground the negative side or add an isolation transformer.
Also, to use a power supply that does not contain a protection circuit, supply power to the NA unit through a fuse or other protective element.

24 V Grounding Power Supply



NA5-□□W□□□□-V1 grounding diagram



3-2-2 Change in Supply Terminals

NS series units are equipped with a screwed supply terminal block, but NA series units' supply terminal block is a connector-type.
Change the power cable, if necessary.

Do not place heavy goods on the cable or pull the cable with force because the connector is mounted in the joint.

---

4 Create NA HMI Project Data

You cannot reuse NS project data for NA series units.
Open a NS project data in CX-Designer to see your system configuration and settings of functional object properties. Then, create an NA project data by using Sysmac Studio.

4-1 Major Differences Between NS and NA

The following table shows major differences between NS and NA that you need to know in creating an NA project data.

Item	NS series	NA
Display resolution	4:3 display	16:9 wide-type display. Based on the object layout in the NS unit, objects will be arranged on the upper left of the NA screen, and a blank space will be left on the right side.
Serial port	Two serial ports for a PLC, bar code reader, and Memory Link device.	Serial 1 port is reserved for future expansion and not for PLC. Use an Ethernet port for connection to the host PLC.
Video input	The video input object can display video inputs from a video input board attached on the expansion I/F or RGB input board on the user screen.	You cannot connect an I/F board usable in NS series units. Video inputs are not available.
Project data	NS series-specific project data. No compatibility with NA series project data.	NA series-specific project data. No compatibility with NS series project data.
Support tool	You can edit and transfer project data with CX-Designer, which included in CX-One.	You can edit and transfer HMI project data with Sysmac Studio.
Memory on a host device	You can directly assign device addresses of a host PLC. Also, you can use variables. Tags are available while connecting via EtherNet/IP.	To specify the data for an HMI object, you can use a global variable. Also, you can specify a device address for a device variable where the global variable is assigned. Note that only tags are available while connecting via CIP Ethernet, and you cannot use device addresses.
The maximum sheets for one screen *A sheet is called as background page in NA.	10 sheets	1 sheet (page) However, you can use a base screen, to which a sheet is applied, as sheet in NA series units. Therefore, you can use more than one sheet.
PT clock setting	You can set or change the internal clock from the system menu, the date and time objects, and the system memory.	You cannot set the clock with the DateTime object. Use the system menu or a subroutine.
Pressing multiple points on the touchscreen at a time	You can press multiple points on the touchscreen at a time except in NS15 units.	NA units do not support pressing multiple points on the touchscreen at a time. However, pressing a function key at the bottom of the NA unit and a point on the touchscreen together is possible. Also, you can press more than one Na's function key simultaneously. Please consider modifying the implementation as needed.
System ten-key	Japanese language input, including single Kanji input, is available with a string input ten-key pad.	The IME input function enables Hiragana and Kanji input using Roman characters. You can input Chinese and other languages.
User-made keypad	You can create a user keypad using command buttons or **Key Button** of Multifunction, and the pop-up function. You can specify a keypad for each functional object.	The custom keypad function allows you to create a user keypad. Keypads are determined depending on what you input: the numeral and the hexadecimal keypads for numerical values, and the string keypad for character strings.
The number of pop-ups	Up to 3 pop-ups at a time	Only 1 pop-up
Macro (Called as Subroutine in NA)	You use NS-specific scripts. Macro set conditions are grouped by project, screen, and functional object. Project: Loading a project, alarm/event occurring, alarm/event cleared, bit changing, and value changing	Visual Basic 2008 (VB hereafter) is adopted. There are limited or extended functions. Subroutine descriptions in this document conform to Visual Basic. A subroutine is defined as either of global subroutine or page subroutine, and unlike NS series, you cannot

Item	NS series	NA
	Screen: Loading a screen and unloading a screen	create a subroutine for each object. Set conditions for subroutines are consolidated in Events. Some macros for NS series can be substituted with the Events and Actions feature of NA series. Please consider the macro behavior in replacing.
Password authentication for manipulating objects	You can create a password authentication, which requires a password for manipulating an object.	Please consider employing the account security method, which requires user authentication with a password on the login page and enables you to switch access to an object by the security level. See the alternative VB code in Chapter 5-9 for your reference.

4-2 Differences in Ethernet Host Connection

All NA series units connect to a host unit in an Ethernet port.
NS series units specifies all SYSMAC-NJ series units as “SYSMAC-NJ”, but in NA series, controllers are set by models, such as NJ, NX, and other. Change settings for the model of the controller to connect.

NS series		NA		
Communication Settings - Host Type	Communication Settings - Protocol	Device References - External Device - Device Configuration		
		Device Vendor	Device Series	[Communication Driver]
SYSMAC-CJ1	FINS	Omron	CJ	FINS Ethernet
SYSMAC-CJ2				
SYSMAC-CJ2	EtherNet/IP	Omron	CJ	CIP Ethernet
SYSMAC-NJ	EtherNet/IP	Omron	NJ	Ethernet
			NX7	
			NY	
			NX1P2	
			NX102	
			NX-CSG320	

4-3 Host Addresses and Variables

4-3-1 How to Assign Data

For NS series units, information about the contacts and channels of a host, which is assigned to a functional object or alarm, is specified by using a device address, variable, or tag (network variable). Device address is referred as just “address” in CX-Designer.

Device to Connect	Data	Data Type Assignment in NS
CJ1/CJ2	Device address	The data type will be automatically selected for a functional object using a device address.
CJ2/NJ	Tag (Network variable)	The data type selected for a variable will be used.
NJ	Global variable	

In NA series, data are assigned to objects with NA *Global Variables* or *System Variables* in all cases.

You need to map host addresses of connecting devices, variables, and tags (network variables) to global variables of the NA series.

Device to Connect	Data	Variable mapping	Data Type Assignment in NA	Remarks
CJ1/CJ2	Device address	Required	Though device addresses do not require data types, you need to	Select a data type according to a functional object used in

Device to Connect	Data	Variable mapping	Data Type Assignment in NA	Remarks
			select adequate data types in the NA series.	the NS unit.
CJ2/NJ	Tag (Network variable)	Required	The data type set for the variable will be used.	
NJ	Global variable	Required		
-	Global variable	Not required	You can map the global variables.	NA's internal variables
-	System variable	Not required	Use the data types given by the system.	

Precautions for Correct Use

When mapping a host address of a connecting device to an NA global variable, pay particular attention to the size of the global variable. For instance, mapping the whole DM area to an array may burden the data transmission and impair the NA unit's responsiveness.

4-3-2 Variable Data Type Conversion

NS series units comply with data types of CJ series and NJ/NX series.
In NA series units, data types of global variables and device variables are VB data type and data types depending on devices, respectively.

When you enter a device variable in **AT** of the **Global Variables** tab page and their data types are different, the data acquired from the device will be automatically converted according to the data type. The data that changed in the HMI will be reversibly converted. Data types other than BCD will be converted to the same types, but named differently.

NS Data Type				NA Data Type		
Data Type	Size	Data Type	Location	Device Variable		Global variable
				CJ	NJ	
Boolean	1-bit	BOOL	Format for storing functional object value, variable, and tag	BOOL		Boolean
Signed integer	1 bytes	SINT		-	SINT	SByte
Unsigned integer	1 bytes	BYTE USINT		-	BYTE USINT	Byte
Signed integer	2-byte	INT		INT		Short
Unsigned integer		WORD UINT CHANNEL		WORD UINT		UShort
Signed integer	4-byte	DINT		DINT		Integer

Unsigned integer		UDINT DWORD		UDINT DWORD		UInteger
Floating point		REAL		REAL		Single
Signed integer	8-byte	LINT		LINT		Long
Unsigned integer		ULINT LWORD		ULINT LWORD		ULong
Floating point		LREAL		LREAL		Double
Character string	Variable length	STRING		STRING		String
Date & Time	-	TIME		-	TIME	Date
		DATE		-	DATE	
		TIME_OF_DAY		-	TIME_OF_DAY	
		DATE_AND_TIME		-	DATE_AND_TIME	

The following shows data types of BCD variables.
Because BCD type is not available in [Global Variables], use a signed or unsigned integer type for signed or unsigned NS data type, respectively.

NS Data Type				NA Data Type		
Data Type	Size	Data Type	Location	Device Variable		Global variable
				CJ	NJ	
Unsigned BCD integer (For CJ only)	2-byte	UINT_BCD	Variable and tag	UINT_BCD	-	UShort
	4-byte	UDINT_BCD		UDINT_BCD	-	UInteger
	8-byte	ULINT_BCD		ULINT_BCD	-	ULong
Unsigned BCD integer	2-byte	BDC2 (Unsigned 1-WORD)	Value storing format for functional objects	UINT_BCD	-	UShort
	4-byte	BDC2 (Unsigned 2-WORD)		UDINT_BCD	-	UInteger
Signed BCD integer	2-byte	BCD1 (Signed 1-WORD, highest-order digit is F) BCD2 (Signed 1-WORD, upper1-bit)		Convert the data type with the PLC program because the signed BCD integer is unavailable in the NA series.		
	4-byte	BCD1 (Signed 2-WORD, highest-order digit is F)				
		BCD2 (Signed 1-WORD, upper 1-bit)				

When you use a structure or a union, pay attention to the member structure and data type consistency of member variables.

4-3-3 Processing BCD Type

If your HMI is connected to a PLC older than the CJ series, in some cases, most of the data in the PLC are treated as the BCD type integer values.

In NS series units, you can determine whether to handle the integers as BCD type or BIN type integer by specifying in the property of a function or functional object. If the data in the PLC are BCD type, they are handled as BCD integers.

On the other hand, in NA series units, only BIN integers are available in internal processing but not BCD integers. However, if data is set to a BCD type integer, such as UINT_BCD, DINT_BCD, LINT_BCD, in the **Data Type** field of the **Device Variables** pane and it is mapped to a global variable, the PLC will handle the data as the BCD type integer and NA can automatically convert BCD-BIN internally. Just after being imported, the data type of the imported device variable is either of CHANNEL, DWORD, or LWORD. Change the data type to UINT_BCD, DINT_BCD, or LINT_BCD, respectively.

This auto-conversion function is not available for a signed BCD integer. You must set variables in the NA series with variable types according to the number of bytes stored, and must convert the BCD and BIN types using a VB program on the NA or a program on the PLC.

4-3-4 Specify Device Address of NS

In the NA series, specify device addresses in the **Device Variables** pane. Enter a device address in the **AT** field.
You can use a device address directly for specifying the functional object data in the NS series. On the other hand, device address specification method in NA is an indirect way using a device variable and global variable: you specify the with a global variable and specify a device Variables for the AT, and a device address for the AT of the device variable. Also, the global variable and device variable have variable types. You need to specify correct types for each variable.

Replace data specification with the initial address and the number of access points, which used for a broken-line graph and macro in NS, with the method using an array containing the same number of elements as the access points.

Specified device addresses in the NS series unit are registered to the CX-Designer's variable table with names "AutoGen + number." Only the initial address of the contact data is registered as BOOL, and the numeral or string data as CHANNEL, respectively. The variable table does not include information of how to handle as other data types, such as signed or unsigned, BCD, array, and others. Check the settings of the functional object to which the address or variable is assigned to select a correct variable type.

4-3-5 How to Connect to CJ Series Unit

For data assignment in connecting to a CJ series PLC via CIP Ethernet, you can use tags only. Therefore, you may need to change the data assignment method or connection method depending on the current data assignment.

			Connection in NA	
		Where to be assigned in NS	FINS Ethernet	CIP Ethernet
Connection in NS	FINS	Device address	With no change	**To tags**
		Variable		
	EtherNet/IP	Device address	With no change	**To tags**
		Variable		
		Tag	**Tags to variables**	With no change

Connection via CIP Ethernet	Replace all the variables and device addresses used for data specification with tags. In addition, register the tags to a CJ series CPU Unit as network variables. Conduct the following procedure. **To Tags** 1. Import variables to device variables following the procedures in "4-3-7 Import CX-Programmer Variable Table to NA Device Variables" and "4-3-9 Import NS Variable Table to NA Device Variables." 2. Click the header **AT** of the **Device Variables** pane in Sysmac Studio to sort the variables by AT. 3. Select the variables whose AT fields are filled and copy them with the Ctrl + C keys. 4. Paste them with the Ctrl + V on the Symbol Table edit pane of CX-Programmer. The **Paste Symbol** dialog appears. Select the **Comment** column and click the **Left** button to move an AT specification to the **Address** column. Click **OK** to finalize variable pasting. 5. Double-click each pasted variable to display the **New Symbol** dialog, then check the **Net. Variable** box and click **OK** to handle the variables as network variables. 6. Return to the **Device Variables** edit pane and delete AT of the variable whose **AT** is set to treat it as tag.
Connection via FINS Ethernet	The network configuration will change following the change in communications from Ether IP. Therefore, you need to change the FINS network configuration, such as FINS node address and FINS routing table. If you are using tags for data assignment, replace the tags with variables. **Tags to variables** 1. First, import variables to device variables following the procedures in "4-3-7 Import CX-Programmer Variable Table to NA Device Variables" and "4-3-9 Import NS Variable Table to NA Device Variables." 2. Click the header **AT** of the **Device Variables** pane in Sysmac Studio to sort

	the variables by AT. Then extract tags whose **AT** fields are empty. Perform the following for the extracted tags. 3. Search for tags with the same names in the variable table edit pane of CX-Programmer. Check the **Address/Value** column. 4. Set the values of **Address/Value** in CX-Programmer to the **AT** fields of the tags in the **Device Variables** pane of Sysmac Studio.

Refer to “NA-series Programmable Terminal Device Connection User's Manual” (V119) for details.

4-3-6 Where to Register NS Variables

In the NS series, device address specifications, variables, and tags are registered to the variable table of CX-Designer. Variables in the NA series are registered as shown in the table below.

NS Connecting Host	Import to
NS internal memory (PTMEM)	Global Variables HMI − Data − Global Variables
Serial connection FINS connection host Ethernet/IP connection host	Device Variables Configurations and Setup - Device References - External Device - Variable *Select the host name for **External Device**.

Refer to Section 3 “Connecting an OMRON NJ/NX/NY-series Controller” in “NA-series Programmable Terminal Device Connection User’s Manual” (V119) for details on importing the variable table while connecting to an NJ series unit.

You can import the data from the CX-Designer variable table following the procedures in “4-3-8 Import NS Variable Table to NA Global Variables” and “4-3-9 Import NS Variable Table to NA Device Variables,” though it is not an intuitive operation like the one Sysmac Studio or CX-Programmer provides.

4-3-7 Import CX-Programmer Variable Table to NA Device Variables

Refer to Section 4 “Connecting an OMRON CJ-series PLC” in “NA-series Programmable Terminal Device Connection User’s Manual” (V119) for details on importing data from the CX-Programmer variable table while connecting to a CJ series unit.

4-3-8 Import NS Variable Table to NA Global Variable

Import the variables assigned to the internal NS memory (PTMEM) to NA’s global variables.

1. Open the Symbol (variable) Table in CX-Designer.
2. Press the **All** button under **Host** to filter hosts.

Symbol Table

Add | Find | Find Unused Symbols | Prev. | Next | Clear searc

Host	Name	Type	Address Type/Number	I/O Comment	Tag
All		All	All		All
PTMEM	AutoGen1	BOOL	$B0		None
PTMEM	AutoGen2	CHANNEL	$W0		None
PTMEM	AutoGen3	BOOL	$SB0		None
PTMEM	AutoGen4	BOOL	$SB11		None
PTMEM	AutoGen5	CHANNEL	$SW6		None
PTMEM	AutoGen6	CHANNEL	$SW7		None
PTMEM	AutoGen7	CHANNEL	$SW8		None
PTMEM	AutoGen8	CHANNEL	$SW12		None
PTMEM	AutoGen9	BOOL	$SB9		None
PTMEM	AutoGen10	BOOL	$B1		None
HOST3	AutoGen11	CHANNEL	00000i0		None
HOST3	AutoGen12	CHANNEL	00000i4		None
HOST4	TAG_Z	CHANNEL[10]			Network Variable

3. Select **PTMEM** to display PTMEM (Internal NS memory) variables only.

Symbol Table

Add | Find | Find Unused Symbols | Prev. | Next | Clear sea

Host	Name	Type	Address Type/Number	I/O Comment	Tag
PTMEM		All	All		All
PTMEM	AutoGen1	BOOL	$B0		None
PTMEM	AutoGen2	CHANNEL	$W0		None
PTMEM	AutoGen3	BOOL	$SB0		None
PTMEM	AutoGen4	BOOL	$SB11		None
PTMEM	AutoGen5	CHANNEL	$SW6		None
PTMEM	AutoGen6	CHANNEL	$SW7		None
PTMEM	AutoGen7	CHANNEL	$SW8		None
PTMEM	AutoGen8	CHANNEL	$SW12		None
PTMEM	AutoGen9	BOOL	$SB9		None
PTMEM	AutoGen10	BOOL	$B1		None

4. Press the Ctrl + A keys to select all and the Ctrl + C keys to copy to the buffer.
5. Paste into an empty Excel sheet.
6. Move column E (I/O comment) to column I.
7. Fill up columns E and F in all the rows with data with “FALSE.” In the same way, enter “0” and “” in columns G and H, respectively.
8. If a string in column D, Address Type/Number, begins with “$H,” change column E to “TRUE.”
9. Insert a column to the left of column D.
10. Delete column A (Host).
11. Select columns from A to H of the rows with data and press the Ctrl + C keys to copy.
12. Select **Data** - **Global Variables** in Sysmac Studio and paste.

Global Variables

Name	Data Type	Initial Value	AT	Retain	Constant	Update Rate	Scaling	Comment
AutoGen1	BOOL		$B0			None	None	
AutoGen2	CHANNEL		$W0			None	None	
AutoGen3	BOOL		$SB0			None	None	
AutoGen4	BOOL		$SB11			None	None	
AutoGen5	CHANNEL		$SW6			None	None	
AutoGen6	CHANNEL		$SW7			None	None	
AutoGen7	CHANNEL		$SW8			None	None	
AutoGen8	CHANNEL		$SW12			None	None	
AutoGen9	BOOL		$SB9			None	None	
AutoGen10	BOOL		$B1			None	None	

13. Unusable Data Type and AT will be shown in pink. Modify them in the next step.

Refer to “4-3-2 Variable Data Type” for how to replace data types.
In this example, change BOOL to Boolean and CHANNEL to Ushort, respectively.

Data in AT column are displayed as error because the letter “$” at the top is not allowed by the Na series variable naming rules.
If a device is assigned to the system memory $SB or $SW, refer to “4-5 System Memory” to replace with a system variable or other.

4-3-9 Import NS Variable Table to NA Device Variables

Import the variables assigned to a host device connected to the Ethernet port or serial port to NA device variables.
If you have imported the variables of the host from the CX-Programmer’s symbol table, variables you are going to import may have the same name and get duplicated.

1. Open the Symbol (variable) Table in CX-Designer.
2. Press the **All** button under **Host** to filter hosts.
3. Press the Ctrl + A keys to select all and the Ctrl + C keys to copy.
4. Paste into an Excel sheet.
5. Delete column A.
6. Insert a column to column C.
7. Select columns from A to D of the rows with data and press the Ctrl + C keys to copy.
8. Select **Device References** - **External Device** - **Variables** in Sysmac Studio. Then Select **Paste** from the right-click menu to import variables.
9. Unusable Data Type and AT will be shown in pink. Modify them in the next step.

Refer to the table in “4-3-2 Variable Data Type” for replacing data types.
For example, importing a variable whose type is SINT or CHANNEL results in an error. Modify the data type to WORD or UINT according to the original data type.

4-4 Project Settings and Functional Objects

This section provides comparative tables of functions of NS series and NA series.
Refer to appendices for details of properties.

4-4-1 Appendix 1: Project Common Settings

NS	NA	Remarks	Item in Appendix
System Memory	System Variable	-	System Memory
Alarm/Event	HMI - User Alarms	-	Alarm
Unit/Scale	HMI - Scale Transformations	Only scale transformation is supported. Unit transformation is not available.	Scale
Broken-line Graph	HMI - Data Group	-	Broken-line Graph
Data Block	HMI − Recipe	Resources is the corresponding function but settings and features are quite different.	Data Block
Data Log	HMI - Data Logging	-	Data Log
Operation Log	Configurations and Setup - Operation Log Settings	-	-
Dialog Setting	No corresponding function	-	-
String Table	HMI - Resources	Resources is the corresponding function but settings and features are quite different.	-

→ Appendix 1: Project Common Settings

4-4-2 Appendix 2: Object Common Settings

NS	NA	Remarks	Item in Appendix
Frame	Standard Controls - Tab Control	-	Frame
Common Setting of Object: Frame	No corresponding function	-	-
Common Setting of Object: Flicker	No corresponding function	-	-
Common Setting of Object: Text Attributes	Object - Properties - Appearance - Font	-	Text Attributes
Common Setting of Object: Control Flag	Object - Properties - Behavior Object - Animations - Enable Object - Animations - Visibility	-	Common of Parts
Common Setting of Object: Size/Position	Object - Properties - Layout	-	

→ Appendix 2: Object Common Settings

4-4-3 Appendix 3: Buttons

NS	NA	Remarks	Item in Appendix
ON/OFF Button (Momentary)	Buttons - MomentaryButton	-	ON/OFF Button ON/OFF Button_Shape
ON/OFF Button (Alternate)	Buttons - ToggleButton	To group objects into a radio button, go Standard Controls - Radio Button.	
ON/OFF Button (SET)	Buttons - SetButton	-	
ON/OFF Button (RESET)	Buttons - ResetButton	-	
Word Button (Set Value)	Buttons - Button	Select **SetVariable** from **Events and Actions** to set an input value.	Word Button Word Button_Shape
Word Button (Increment/Decrement)	Button - Button	Select **IncreaseVariable** or **DecreaseVariable** from **Events and Actions**, to set increase/decrease value.	
Word Button (Display Pop-up Menu)	Standard Controls - DropDown	-	
Command Button (Switch Screen)	Buttons - Button	Select **ShowPage** from **Events and Actions** to specify an destination screen.	Command Button Command Button_Function Command Button_DB
Command Button (Backward)	Button - Button	Select **ShowPreviousPage** from **Events and Actions**.	
Command Button (Key Button)	-	This function cannot be substitute by a part. A subroutine can partly perform the function.	
Command Button (Control Pop-up Screen - Close pup-up screen)	Button - Button	Select **ClosePage** from **Events and Actions** to specify the page name to close.	
Multifunction	Button - Button	No dedicated part. Setting more than one event or action in **Events and Actions** enables to perform multiple functions with one part.	Multifunction Multifunction_Function

→ Appendix 3: Buttons

4-4-4 Appendix 4: Lamps

NS	NA	Remarks	Item in Appendix
Bit Lamp	Lamps - Bit Lamp	-	Bit Lamp Bit Lamp_Shape
Word Lamp	Lamps - Data Lamp	-	Word Lamp Word Lamp_Shape
Text	Standard Controls - Label or Standard Controls - TextBox	-	Text
Text (Message Display)	Lamps - Data Lamp	Unlike NS series units, you cannot change the font type and size for every state. Colors of backgrounds and texts are changeable.	-
Numeral Display & Input/ String Display Input (Input Enable)	Standard Controls - Data Edit	-	Numeral Display String Display
Numeral Display & Input/ String Display Input (Input Disable)	Standard Controls - Data Display	-	
List Selection	Standard Controls - ListBox	-	List
Thumbwheel Switch	No corresponding function	There is no replaceable single object. You can create a similar function by combining data display parts and event/action of a button.	-
Date Object	Standard Controls - DateTime	Displaying date and time are performed in one setting. You can display date only or time only by configuring the display format. In NA series units, the date/time setting is not available in the form of functional object.	DateTime DateTime_Format
Time Object			
Bitmap	Standard Controls - Image	-	BMP

→ Appendix 4: Lamps

4-4-5 Appendix 5: Graphs

NS	NA	Remarks	Item in Appendix
Level Meter	Gauges - Linear Gauge (Horizontal/Vertical)	-	Level Meter
Analogue Meter	Gauges - Rotational Gauge	-	Analogue Meter
Broken-line Graph	HMI Controls - Broken-line Graph	-	Broken-line Graph
Data Log Graph	HMI Controls - Trend Graph	-	Data Log DateTime_Format

→ Appendix 5: Graphs

4-4-6 Appendix 6: Alarms

NS	NA	Remarks	Item in Appendix
Alarm/Event Display	No corresponding function	-	-
Alarm/Event Summary and History	HMI Controls - User Alarms Viewer	*HistoricalMode* is selected	Alarm History
Data Block Table	HMI Controls - Recipe Viewer	-	Data Block
Contents Display	Lamps - Data Lamp	You cannot change the color or font of texts for every state.	Contents Display
Video Display	No corresponding function	-	-
Temporary Input	No corresponding function	-	-
Consecutive Line Drawing	No corresponding function	-	-

→ Appendix 6: Alarms

4-5 System Memory

NS series units has bits and integers for states of system operation in the range of $SB0 to 63 and $SW0 to 40 in the PT Memory.

In the NA series, you can duplicate the system memory functions of the NS series with system variables, Events and Actions function, and subroutines.
There are no system variables for the functions unavailable in NA series, e.g., Video Input.
A system variable that has a corresponding function may have different behavior or value, e.g., beginning with 0 or 1.
Refer to System Memory in “4-4-1 Appendix 1: Project Common Settings” for details.

For the system memories $SB54 to 58 and $SW39, regarding the password function, see “5-9 Password.”

4-5-1 System Memory: Variable Mapping

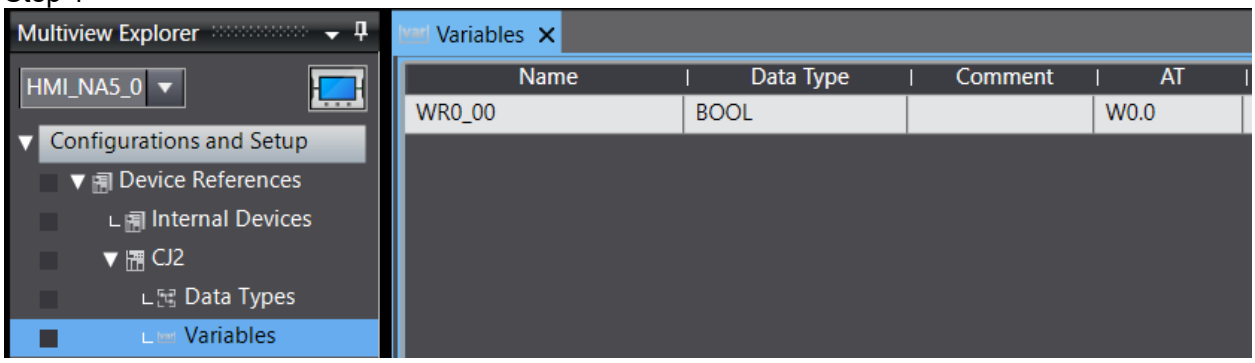
This section shows how to replace system memories, supported by variable mapping in the System Memory sheet in “Appendix 1: Project Common Settings.”

The procedure depends on whether you have assigned the system memory to a connecting host unit or used inside the NS unit.

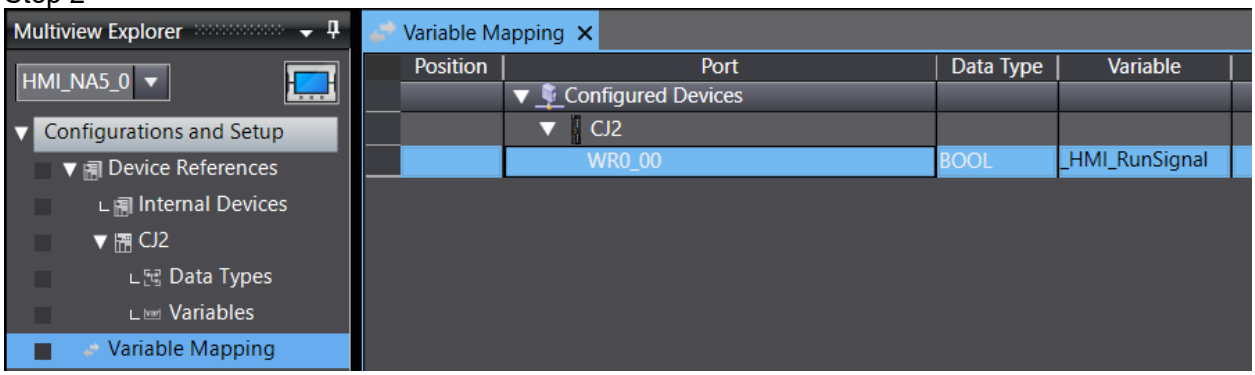
The following provides how to replace the system memory that has been assigned to a connecting host unit.
This is an example of the system memory $SB0 assigned to WR0.00 in the host unit.

1. Create a variable of WR0.0 in the Variables tab in Device References.
2. In the Variable Mapping tab, assign the system variable *_HMI_RunSignal* to the variable you have created in Step 1.

Step 1



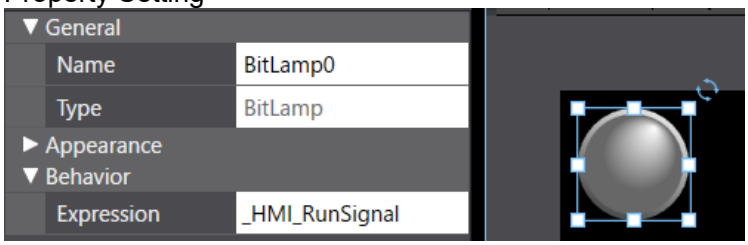
Step 2



The following describes how to replace the system memory that you have used inside the NS unit.
This is an example of the system memory $SB0 assigned to the display address of a Bit Lamp Object.

1. Enter *_HMI_RunSignal* in the Expression property of the Bit Lamp Object.

Property Setting



Other system memories, which are supported by variable mapping, can be replaced in the same manner.

4-5-2 System Memory: Global Event

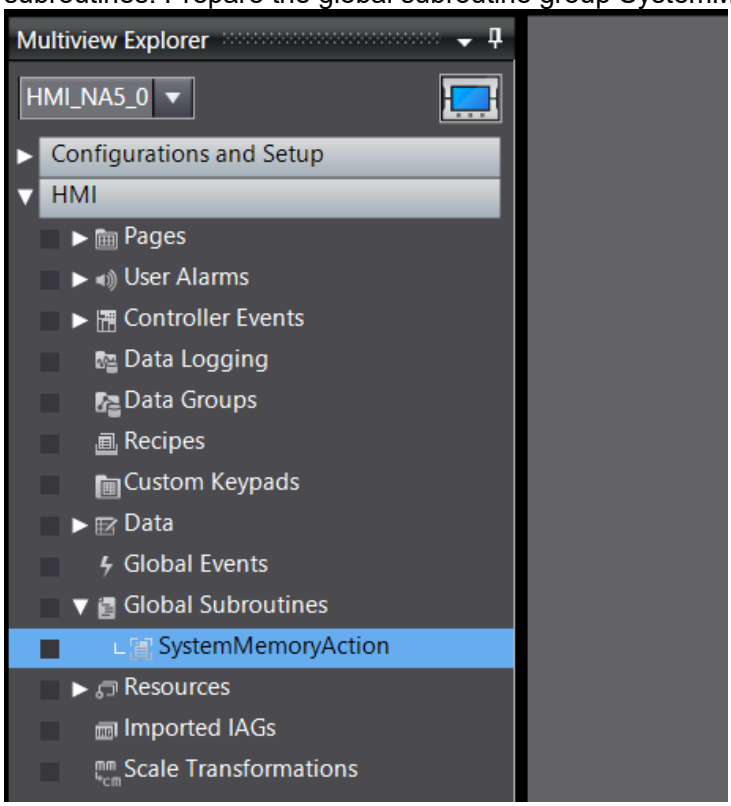
This section shows how to replace system memories, supported by global event in the System Memory sheet in “Appendix 1: Project Common Settings.”
The following describes how to replace the system memory that you have used inside the NS unit. A variable name is either SB** or SW**.
If you have assigned the system memory to the connecting host unit, map the system memory to a variable in advance.
Then, replace $SB** or $SW** with the mapped variable name.

1. Write a subroutine that will be executed when $SB** turns ON or OFF, according to the table below.
2. In **Condition** of **Events** under **Events and Actions** of the global event, Enter *Variable 1* in the **Expression** box and any event in the **Actions**.

   Enter *Not Variable 1* in the **Expression** box and any event in the **Actions**.

   This event will be executed only once when the condition is met.

You use Global Subroutines in this chapter.
This chapter describes the procedure using a global subroutine group *SystemMemoryAction* to add subroutines. Prepare the global subroutine group SystemMemoryAction in advance.



NS System Memory		How to Reproduce in NA	
		Execution Condition	Setting Up Global Events
$SB6	Brightness Adjust (High) *1	ON	Click **Actions** - **SetVariable**, and enter a value for the system variable *_HMI_Brightness*. $SB7	Brightness Adjust (Middle) *1	ON	Click **Actions** - **SetVariable**, and enter a value for the system variable *_HMI_Brightness*. $SB8	Brightness Adjust (Low) *1	ON	Click **Actions** - **SetVariable**, and enter a value for the system variable *_HMI_Brightness*. $SB12	Continuous Buzzer	ON	Click **Actions** - **BuzzerOn**, and select *Continuous* in **Buzzer Type**. 		OFF	Select *BuzzerOff* in **Actions**. $SB13	Short Intermittent Buzzer	ON	Click **Actions** - **BuzzerOn**, and select *Intermittent Short Pulse* in **Buzzer Type**.

<table>
<tr><th colspan="2" rowspan="2">NS System Memory</th><th colspan="2">How to Reproduce in NA</th></tr>
<tr><th>Execution Condition</th><th>Setting Up Global Events</th></tr>
<tr><td colspan="2" rowspan="2"></td><td></td><td> </td></tr>
<tr><td>OFF</td><td>Select BuzzerOff in Actions.
 </td></tr>
<tr><td rowspan="2">$SB14</td><td rowspan="2">Long Intermittent Buzzer</td><td>ON</td><td>Click Actions - BuzzerOn, and select Intermittent Long Pulse in Buzzer Type.
 </td></tr>
<tr><td>OFF</td><td>Select BuzzerOff in Actions.
 </td></tr>

</table>

NS System Memory		How to Reproduce in NA	
		Execution Condition	Setting Up Global Events
			$SB32	Initialize Alarm/Event History	ON	Substitute this with the NA function *ClearUserAlarmLog()*. Copy and paste the following subroutine in the global subroutine in advance. Sub SB32Action 'Initialize Alarm/Event history ClearUserAlarmLog() 'Automatically off SB32 SB32 = False End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. $SB33	Save Alarm/Event History	ON	Select *SaveUserAlarmLogToFile* for **Actions**. Since $SB33 automatically turns OFF after the execution, add an action for the process of turning OFF $SB33. In the following settings, the log data will be saved as UserAlarmLog.csv in the Root folder in the SD card. $SB35	Initialize Data Log	ON	Substitute this with the NA function *ClearDataLogBuffer(DataSetName)*. Copy and paste the following subroutine in the global subroutine in advance. Sub SB35Action 'Initialize datalog 'Specify data set to initialize as argument ClearDataLogBuffer("DataSetName") 'Automatically off SB35 SB35 = False

NS System Memory		How to Reproduce in NA	
		Execution Condition	Setting Up Global Events
			End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. $SB36	Save Data Log	ON	Substitute this with the NA function *ExportDataLogBuffer(DataSetName).* Copy and paste the following subroutine in the global subroutine in advance. Sub SB36Action 'Save datalog 'Save data set specified as argument ExportDataLogBuffer("DataSetName") 'Automatically off SB36 SB36 = False End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. $SB37	Initialize Operation Log	ON	Substitute this with the NA function *ClearOperationLogBuffer().* Copy and paste the following subroutine in the global subroutine in advance. Sub SB37Action 'Initialize operation log ClearOperationLogBuffer() 'Automatically off SB37 SB37 = False End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. 
NS System Memory		How to Reproduce in NA	
		Execution Condition	Setting Up Global Events
$SB38	Save Operation Log	ON	Substitute this with the NA function *SaveOperationLogToFile(FileName)*. Copy and paste the following subroutine in the global subroutine in advance. Sub SB38Action 'Save operation log 'Specify path to save as argument SaveOperationLogToFile("¥SDCard¥OperationLog.csv") 'Automatically off SB38 SB38 = False End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. $SB49	Stop Memory Card	ON	Substitute this with the NA function *EjectSDMemory()*. Copy and paste the following subroutine in the global subroutine in advance. Sub SB49Action 'Make SD card removable EjectSDMemory() 'Automatically off SB49 SB49 = False End Sub Then, create an event, select CallSubroutine in Actions, and register the subroutine. The following is an example. $SW10	Current Label No.	When changing value	Set *SetLanguage* in **Actions**. Specify the value of SW10 in **Expression** to display the label in the corresponding language. In the following configuration, the label will be displayed in Japanese when SW10 = 0, and in English when SW10 = 1.

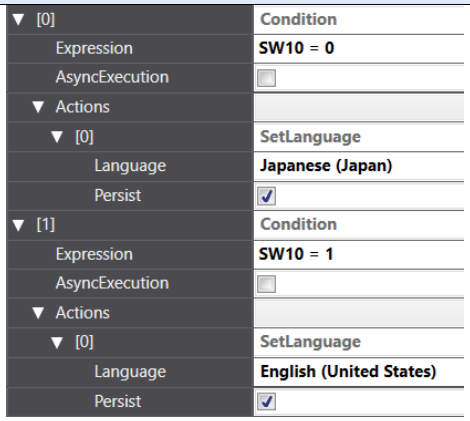
<table>
<tr><th colspan="2" rowspan="2">NS System Memory</th><th colspan="2">How to Reproduce in NA</th></tr>
<tr><th>Execution Condition</th><th>Setting Up Global Events</th></tr>
<tr><td></td><td></td><td></td><td>



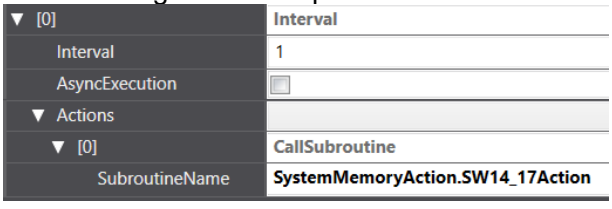
Checking the Persist box retains the display language settings after turning OFF and ON the NA unit.</td></tr>
<tr><td>$SW14 to 17</td><td>Current Date and Time</td><td>Interval</td><td>Copy and paste the following subroutine in the global subroutine in advance.
Sub SW14_17Action
'Convert minute and second
Dim second = _HMI_Second
Dim minite = _HMI_Minute
SW14 = minite * 100 + second

'Convert date and time
Dim hour = _HMI_Hour
Dim day = _HMI_DateTime.Day
SW15 = day * 100 + hour

'Convert year and month
Dim month = _HMI_DateTime.Month
Dim year = _HMI_DateTime.Year
year = year Mod 100
SW16 = year * 100 + month

'Convert day of the week
SW17 = _HMI_DateTime.DayOfWeek
End Sub

Then, create an event, select CallSubroutine in Actions, and register the subroutine.

The following is an example.


</td></tr>
</table>

*1: In the NS series, if the backlight brightness adjustment system bits turned ON at the same time, the higher brightness bit has the priority.

In the NA series, the brightness adjustment setting of the system bit that turned on last is enabled.

*2: In NS series units, you are allowed to operate a dialog shown by the system, but in NA series, all the touch-screen operations are prohibited.

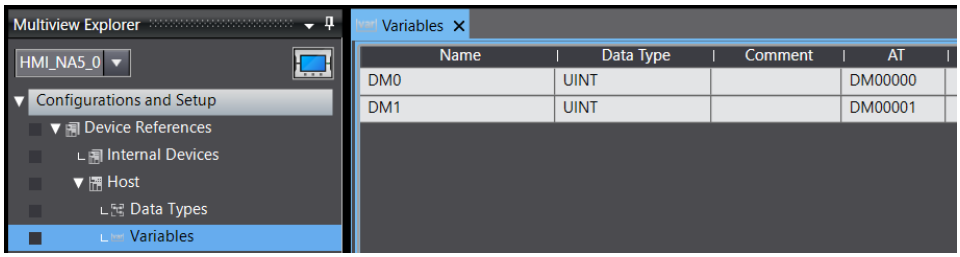
If the above system memories are assigned to the connecting host unit, you can replace the process of controlling the system memories from the connecting host unit by mapping the system memories following the method in “4-5-1 System Memory: Variable Mapping" and assigning them to expressions in the global event.

4-5-3 System Memory: Supported by VB

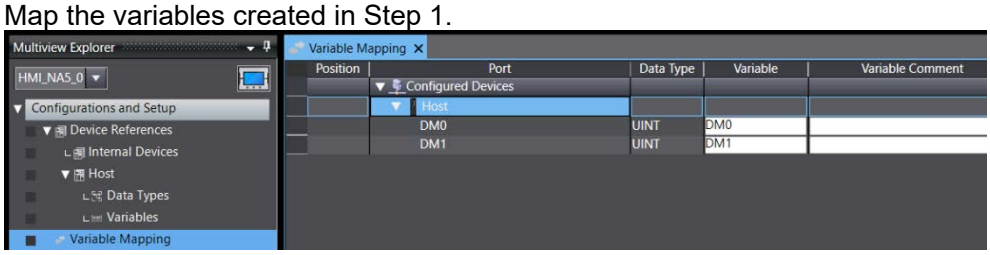
This section shows how to replace system memories, supported by VB in the System Memory sheet in “Appendix 1: Project Common Settings.”

Replace the system memories $SW0 (Current screen number) and $SW1 (Current pop-up screen number) using the procedure shown below.
In this example, $SW0 is assigned to DM0 in the connecting host unit, and $SW1 is assigned to DM1.
If other addresses have been assigned, please read as above.
The control method of current screen numbers differs in the NS and NA series. Therefore, the behavior cannot be duplicated perfectly.
For example, the connecting host unit can specify a pop-up page number to display on the NA unit, but the NA unit does not notify the pop-up page number to the connecting host unit.

1. Create variables DM0 and DM1, to which the connecting host unit is assigned, in the Variables tab in Device References.



2. Map the variables created in Step 1.



3. Copy and paste the following to the global subroutine.

```
Dim switchingPage As Boolean

'Page number in Host to NA
Sub ConvertHostPageNoToNAPageNo
  If switchingPage Then Exit Sub
  switchingPage = True

  BeforePageNo = DM0
  _HMI_CurrentPageIndex = DM0

  switchingPage = False
End Sub

'Page number in NA to Host
Sub ConvertNAPageNoToHostPageNo
  If switchingPage Then Exit Sub
  switchingPage = True

  BeforePageNo =CType(_HMI_CurrentPageIndex, UShort)
  DM0 = CType(_HMI_CurrentPageIndex, UShort)

  switchingPage = False
End Sub

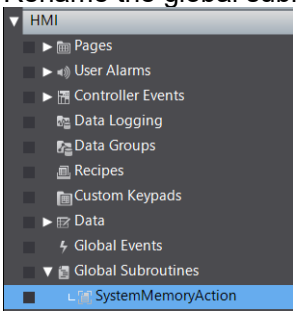
'Pop-up page number in Host to NA
'Pop-up page number is notified from Host to NA only
Sub ConvertHostPageNoToNAPageNoPopupPage
  If switchingPage Then Exit Sub
  switchingPage = True

  If DM1 = 0 Then
    ClosePage(_HMI_CurrentPage)
    BeforePopupPageNo = DM1
    switchingPage = False
    Exit Sub
  End If

  BeforePopupPageNo = DM1
  _HMI_CurrentPageIndex = DM1

  switchingPage = False
End Sub
```

4. Rename the global subroutine group you have edit in Step 3 as *SystemMemoryAction*.



5. Register *BeforePageNo* and *BeforePopupPageNo* in the global variable table.

Global Variables

Name	Data Type	Initial Value	AT	Retain	Constant	Update Rate	Scaling	Comment
DM0	UShort		Host.DM0	☐	☐	500 Milliseconds	None	
DM1	UShort		Host.DM1	☐	☐	500 Milliseconds	None	
BeforePageNo	UShort			☐	☐	None	None	
BeforePopupPageNo	UShort			☐	☐	None	None	

6. Add the following events in the Global Events tab page.

Global Events

Events	< Select Event to Add >
[0]	Condition
Expression	DM0 <> BeforePageNo
AsyncExecution	☐
Actions	< Select Action to Add >
[0]	CallSubroutine
SubroutineName	SystemMemoryAction.ConvertHostPageNoToNAPageNo
[1]	Condition
Expression	_HMI_CurrentPageIndex <> BeforePageNo
AsyncExecution	☐
Actions	< Select Action to Add >
[0]	CallSubroutine
SubroutineName	SystemMemoryAction.ConvertNAPageNoToHostPageNo
[2]	Condition
Expression	DM1 <> BeforePopupPageNo
AsyncExecution	☐
Actions	< Select Action to Add >
[0]	CallSubroutine
SubroutineName	SystemMemoryAction.ConvertHostPageNoToNAPageNoPopupPage

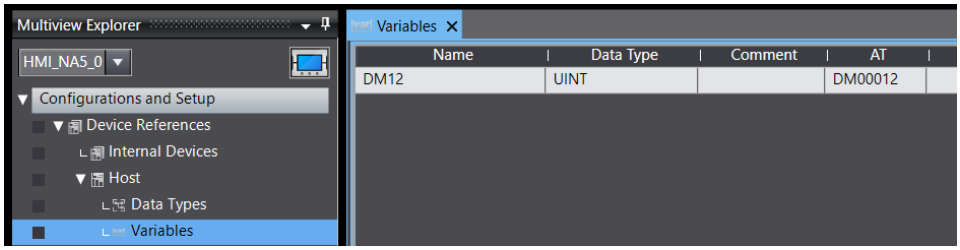
The table provides expressions and subroutines for events described in Step 6.
You can copy and paste them for adding events.

Event No.	Expression	Subroutine
0	DM0 <> BeforePageNo	SystemMemoryAction.ConvertHostPageNoToNAPageNo
1	_HMI_CurrentPageIndex <> BeforePageNo	SystemMemoryAction.ConvertNAPageNoToHostPageNo
2	DM1 <> BeforePopupPageNo	SystemMemoryAction.ConvertHostPageNoToNAPageNoPopupPage

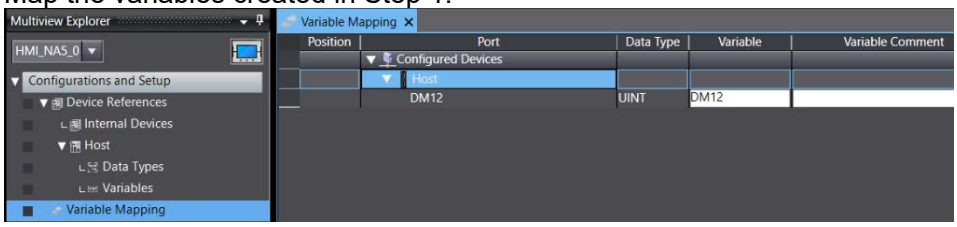
Note: Setting a screen number 10,000 or greater will cause an error in the above method.
Do not set 10,000 or greater for the screen number.
In addition, if you use the pop-up screen number currently displayed as the input condition in the ladder diagram of the connecting host unit, the ladder diagram may not run properly.
Change the input condition of the ladder to the current screen number, or other workaround is necessary.

You can duplicate $SW12, Backlight Brightness Control (32 levels), using the following procedure.
In this example, $SW12 is assigned to DM12 in the connecting host unit.
If other addresses have been assigned, please read as above.

1. Create a variable of DM12 in the Variables tab in Device References.



2. Map the variables created in Step 1.



3. Copy and paste the following to the global subroutine.

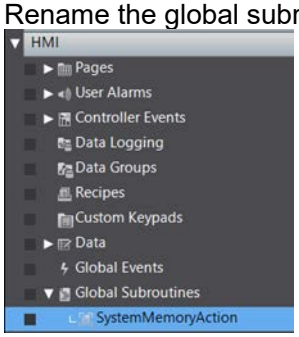
```
Const MaxBrightness As Integer = 200
Const MaxBrightnessLevel As Integer = 32
Const BrightnessInterval As Double = CType(MaxBrightness, Double) /
CType(MaxBrightnessLevel, Double)
Dim RequiredBrightness As Integer = MaxBrightness 'Default value

Sub ChangeBrightness
  BeforeBrightness = DM12
  _HMI_Brightness = TranslateBrightnessLevel(DM12)
End Sub

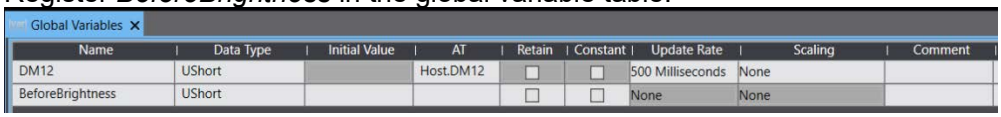
'1->1
'.....
'32->200
Function TranslateBrightnessLevel(brightnessLevel As Integer) As Integer
  If brightnessLevel < 1 Then
    Return 1
  Else If brightnessLevel >= MaxBrightnessLevel Then
    Return MaxBrightness
  End If

  Return Math.Round(BrightnessInterval * brightnessLevel)
End Function
```

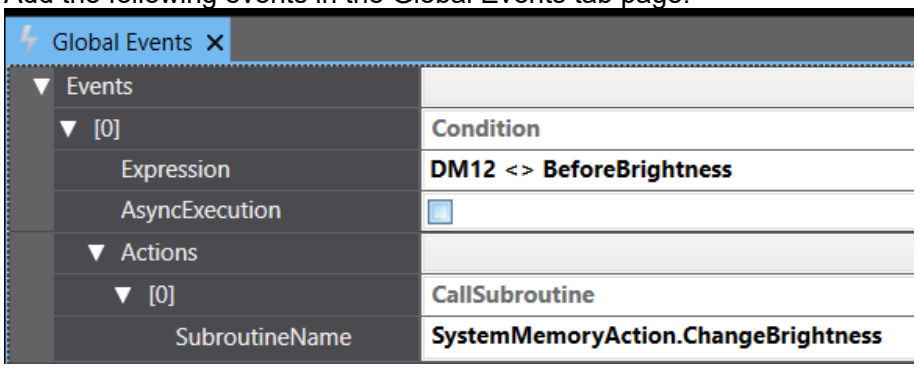
4. Rename the global subroutine group you have edit in Step 3 as *SystemMemoryAction*.



5. Register *BeforeBrightness* in the global variable table.



6. Add the following events in the Global Events tab page.



The table provides expressions and subroutines for events described in Step 6.
You can copy and paste them for adding events.

Event No.	Expression	Subroutine
0	DM12 <> BeforeBrightness	SystemMemoryAction.ChangeBrightness

4-5-4 System Memory: Array

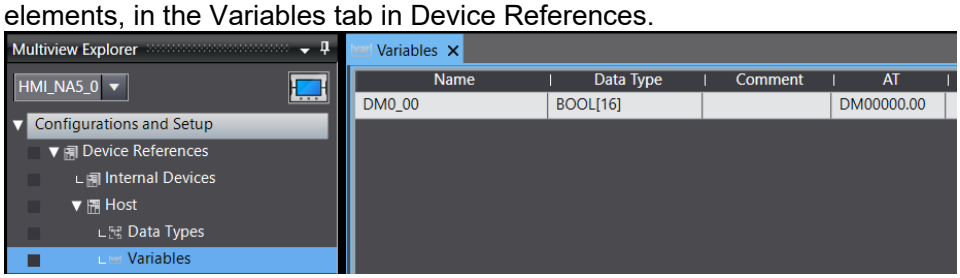
This section shows how to replace system memories, Array in the System Memory sheet in “Appendix 1: Project Common Settings.”

You can replace the system memories $SW27 to 36 (offset value for index I0 to I9) using the following procedure.
You will use $SW27 to 36 for the indirect reference of address. Therefore, look up the address range for the indirect reference in advance, using the cross reference or another method.

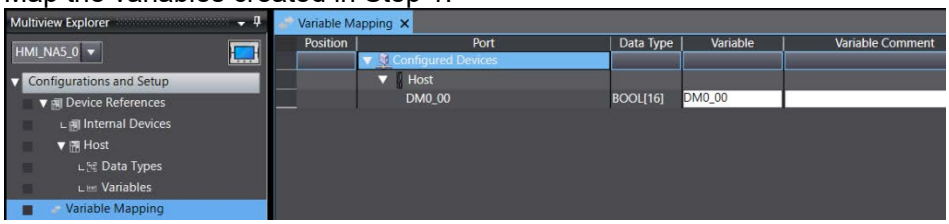
- Example of indirect reference with ON/OFF Button Object (bit data)
  This section describes the replacing method using the following setting.

Object used	ON/OFF Button Object
Address used for	Output and Display addresses
Indirect reference address range	D0.00 to 0.16
System memory	SW27

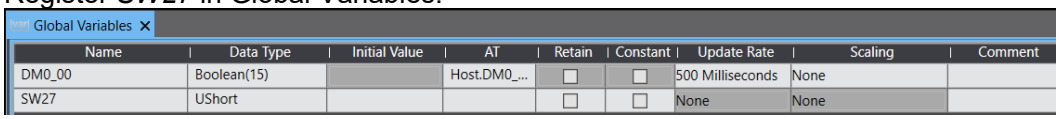
1. Create an array, which is assigned to DM0.00 in the connecting host unit and has 16 elements, in the Variables tab in Device References.



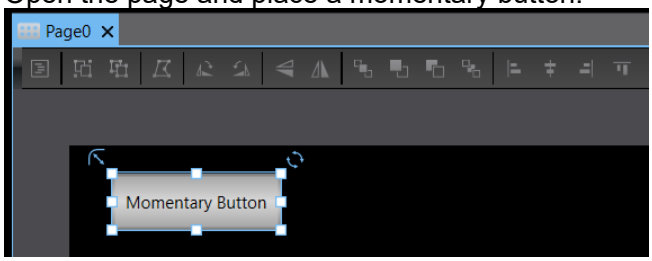
2. Map the variables created in Step 1.



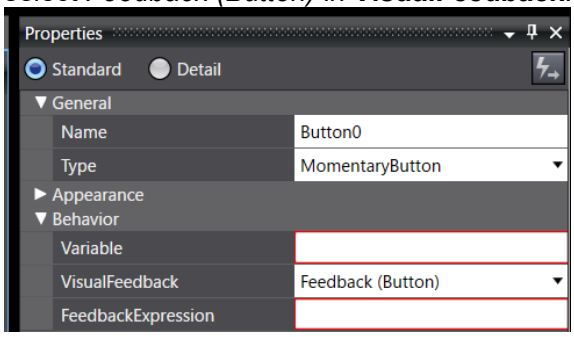
3. Register *SW27* in Global Variables.



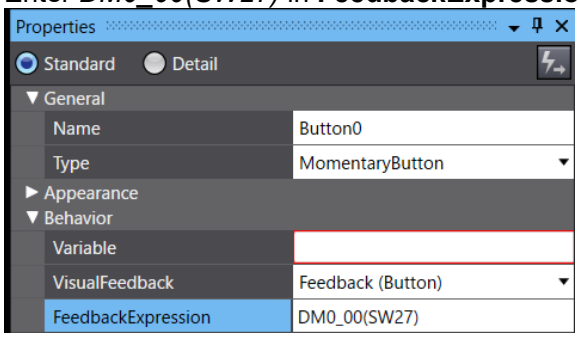
4. Open the page and place a momentary button.



5. Open the Properties pane while selecting the momentary button created in Step 4. Then, select *Feedback (Button)* in **VisualFeedback**.



6. Enter *DM0_00(SW27)* in **FeedbackExpression.**

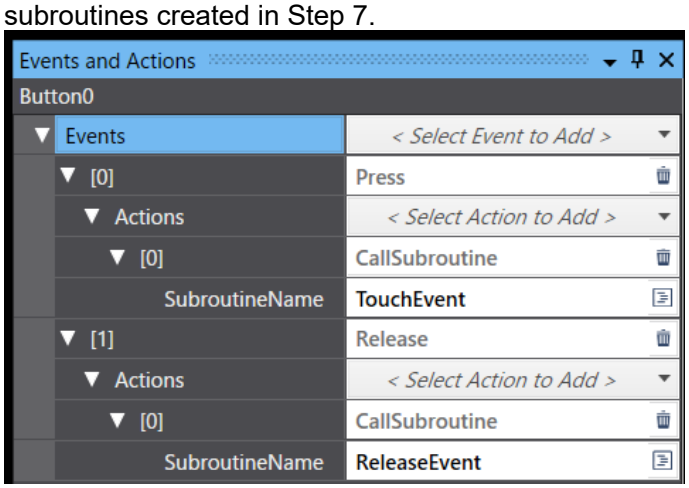


7. Open Page Subroutines to copy and paste the following.

```
Sub TouchEvent
  DM0_00(SW27) = True
End Sub

Sub ReleaseEvent
  DM0_00(SW27) = False
End Sub
```

8. In **Events and Actions** of the button, add *Press* and *Release* events. Then, assign the subroutines created in Step 7.

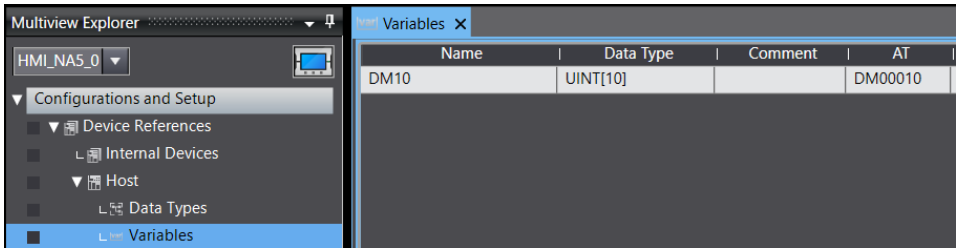


Note: When setting the Variable property, you cannot specify a variable as an index for an array. Therefore, the elements of the array that turns ON/OFF are indirectly referenced in the subroutine.
In the Expression property, you can specify variable as an index for an array.
You can specify an expression as an index to move the offset position.

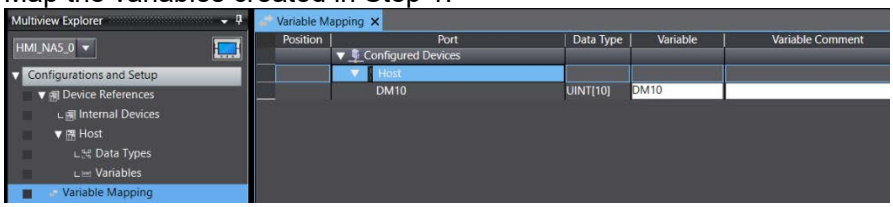
- Example of indirect reference with Numeral Display/ Input Object (word data)
  This section describes the replacing method using the following setting.

Object used	Numeral Display and Input
Address used for	Address
Indirect reference address range	D10 to 19
System Memory	SW27

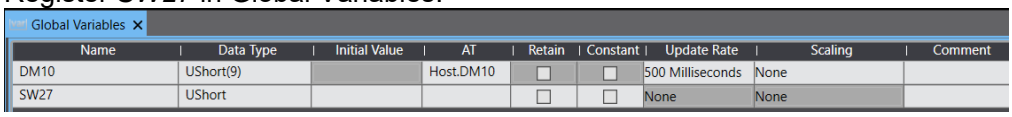
1. Create an array, which is assigned to DM10 in the connecting host unit and has 10 elements, in the Variables tab in Device References.



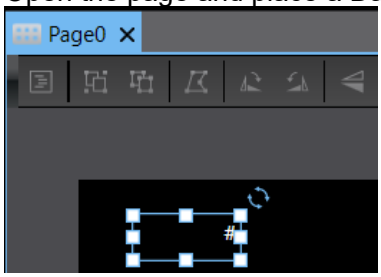
2. Map the variables created in Step 1.



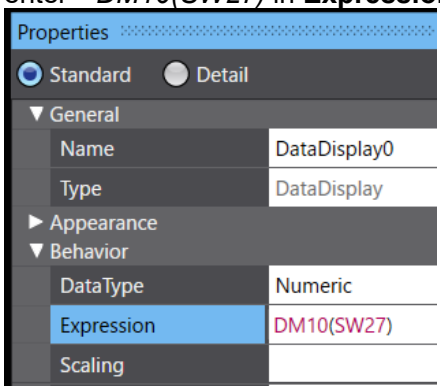
3. Register *SW27* in Global Variables.



4. Open the page and place a Data Display Object.



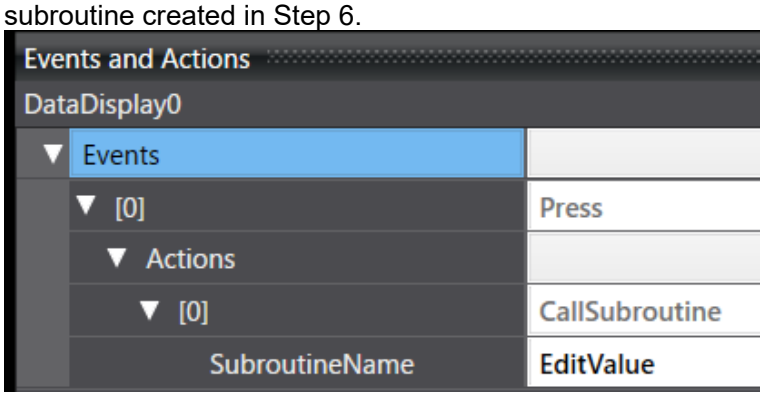
5. Open the Properties pane while selecting the Data Display Object created in Step 4. Then, enter *DM10(SW27)* in **Expression**.



6. Open Page Subroutines to copy and paste the following.

```
Sub EditValue
  Dim val As String = "DM10(" & SW27 & ")"
  EditVariable(val, , , , , , , , , )
End Sub
```

7. In **Events and Actions** of the Data Display Object, add *Press* event. Then, assign the subroutine created in Step 6.



4-6 About Macro

The Macro Functionality of the NS series enables you to add a new function to the basic functions by writing a program.

Macros can be replaced with subroutines in the NA series. You can write codes with VB, but a part of features and library functions is supported. Refer to Subroutine Reference Manual for usable functionalities and library functions.

You can register a functionality common with screens as Global Subroutine and a functionality run on the currently displayed screen only as Page Subroutine.
It is possible to call and execute a subroutine from a global event, object event, and button or lamp on the screen.
If a functionality you want is prepared as an Action, you do not have to write a subroutine; you can select the action to execute an event since executing a subroutine is one of the actions. In addition, you can specify more than one action to an event to combine formated processing and subroutines.

Also, NA subroutines run on Visual Basic. Refer to information from Microsoft and third-party vendors for basic knowledge like syntax, grammar, and variables of Visual Basic.

4-6-1 Macro Execution Conditions

The table below shows the relations of NS macro execution conditions and NA subroutine execution conditions.

NS Macro Execution Condition		NA Subroutine Execution Condition	
Classification	Macro Execution Condition	Location	Execution Condition
Project	When loading a project	Global event	ProjectInitialization
	Alarm/Event ON	User alarm	Raised
	Alarm/Event OFF		Acknowledged Cleared
	Bit change: ON/OFF	Global event	＊2
	Bit change: Rise		
	Bit change: Fall		
	Value change: Value change		
	Value change: Value = Set value		Condition: <Variable> = <Set value>
	Value change: Value > Set value		Condition: <Variable> > <Set value>
	Value change: Value < Set value		Condition: <Variable> < <Set value>
Screen	When loading a screen	Page	PageDisplayed
	When unloading a screen		PageHidden
Part object	When pressing a display area Touch ON	Button, Shape, Image, Data display, Text box	Press
	Touch OFF		Click Release
	When selecting a list	List box DropDown	SelectionChanged

NS Macro Execution Condition		NA Subroutine Execution Condition	
	Before inputting numeral Before inputting string Before inputting numeral and string	Global event or Page	No equivalent execution condition (*1)
	Before writing numeral Before writing string Before writing numeral and string		
	When changing numeral or string		＊2
	Value change: Numerical value = Set value		Condition: <Variable> = <Set value>
	Value change: Numerical value > Set value		Condition: <Variable> > <Set value>
	Value change: Numerical value < Set value		Condition: <Variable> < <Set value>
	When changing value : Execute when ON/OFF		Condition: <Variable> = <Set value>
	When changing value : Execute when ON		
	When changing value : Execute when OFF		
	Alarm/Event selected	-	No equivalent execution condition

*1: Register HMI_IsDataInput_before (variable type: Boolean) to global variables. Then, detect a change of the system variable, _HMI_IsDataInput, with the following expression in **Events and Actions** - **Event** - **Condition** and **Events and Actions** - **Action** - **Subroutine**, in **Global Events** or **Page**.

Event	Condition	_HMI_IsDataInput <> HMI_IsDataInput_before
Action	CallSubroutine	OnChangeDataInput

In the subroutine OnChangeDataInput:

```
Sub OnChangeDataInput
  If _HMI_IsDataInput_before
    Write to REM
  Else
    Start input to REM
  End if
  HMI_IsDataInput_before = _HMI_IsDataInput
End Sub
```

You can get changes in numeric or string data input. However, Macro execution conditions of the NA series are not the same as those of the NS series: for example, before inputting and after starting inputting, and before writing and during writing to after finishing writing.

＊2: With the NS series, changes in numerical values and character strings that are mainly monitored by each part can execute macros. However, the NA series does not have similar execution conditions for each object, and you must configure them for a global event or page.

In addition, you need to prepare a variable to save the previous value separately from the monitored variable. Compare the monitored variable with the previous value in the subroutine, and if they do not match, detect a change of value and assign the variable value to the previous value.

You can detect a value change without preparing the previous value if it is a bit change rather than a change in a numeral or character string. In other words, when the latest value is True, the bit is considered raised; when the latest value is False, the bit is considered fell.

Also, you can use **Standard Controls** - **CheckBox** for an execution condition on the bit change. The event **Checked** in **Events and Actions** of a check box object corresponds to **ON** (up-differentiated), and **Unchecked** corresponds to **OFF** (down-differentiated).

4-6-2 Variables Used in NS Macros

NS-series macros use PT Memories as storage destinations for calculated values and as arguments. Variables are not allowed.
On the contrary, only variables are available in the NA series. Replace the PT memories with global variables or variables defined in a VB program. However, the sample functions described later use array variables representing the virtually defined PT memories. In other words, we are using the number of array indexes as an argument.

4-6-3 About PT Memory

For the PT memories used in the NS-series macros, define the following global variables as arguments of sample functions that substitute macro functions, and describe them. If you do not use a sample function, you do not have to define the global variables.
If you have used $W and $HW in the 2-word or longer data type, the following variables are not available. Prepare new variables.

NS	NA		
	Variable Name	Data type	Retain Attribute
$B	NS_Memory_B	Boolean(32768)	☐
$W	NS_Memory_W	Ushort(32768)	☐
$HB	NS_Memory_HB	Boolean(8192)	☑
$HW	NS_Memory_HW	UShort(8192)	☑

■ PT Memory Size Adornment
You can specify the word size by adding the letter “W” or “L” at the end of a PT memory.
For the NA series, use variable types.

■ Access to Numerals by Bit-type PT Memory
In the NS series, by specifying the number of bits following ":" after the Bit-type PT memory in the macro, you can handle up to 32 bits collectively as an Integer-type value in units of 4 bits.
The NA series does not have a corresponding functionality.

■ Indexed Variable
In the NS series, by adding either of "I0" to "I9" after the PT memory, you can reference the PT memory address numbers relatively slid by the amount specified with the index registers $SW27 to $SW36.
Though you cannot use indexed variables in the NA series, PT memories defined above can achieve the equivalents: PT memories use array number for accessing, and adding/subtracting an offset value to/from an array number works similarly as index specification.

4-6-4 About Host Address (Argument for READCMEM and WRITECMEM)

A host address can be the argument for the NS macro functions, READCMEM and WRITECMEM. Because these macro functions are difficult to replace, a replacing method for this argument is omitted.

4-6-5 Different Behaviors from NS Macros

■ Overflow on variable assignment

NS	Variables are assigned to the extent possible, truncating the high-order digits. The running program will not stop and continue.
NA	An overflow exception occurs and the subroutine function terminates at the point. The error message will appear at the bottom of the screen. To have the same behavior as NS, enclose the assignment location with “Try” and “End Try” to ignore the exception.

■ Assigning a decimal number to an integer

NS	Omit decimals and assign the integer part only.
NA	Round-off the decimals to assign. For example, there are Integer-type variables A, B, and C and the original expression is: A = B / C The calculated value will be rounded, so describe as the following: A = B / C : IF A > (B / C) Then A = A – 1 You can assign the value rounding the decimals as in NS.

4-6-6 Replacing NS Macro Function

This section provides a correspondence table for replacing the NS macro functions with NA VB.

Here we use the codes shown in the table to explain arguments.

Variable Type in NS	Argument Code	Variable Type in NA
Bit	B	Boolean
WORD	w, w1, w2	Short, UShort
DWORD	D	Long, ULong
FLOAT	f, f1, f2	Single, Double
Internal memory	M, M1, M2	Integer: Array number of the array NS_Memory_□(m)
Object ID/ Page number	n	String (Object name/ page name)

The table below provides the NS macro functions and their alternate VB functions and expressions.
The grayed cells represent Math class library functions that are not mentioned in Subroutine Reference Manual. Their operations are not guaranteed.

NS Macro Function	Argument and Return Value	NA VB Function and Expression
Numerical Operation and Value Conversion		
ACOS	FLOAT ACOS(f)	Math.Acos(f)
ASIN	FLOAT ASIN(f)	Math.Asin(f)
ATAN	FLOAT ATAN(f)	Math.Atan(f)
ATAN2	FLOAT ATAN2(f1, f2)	Math.Atan2(f1, f2)
BCD	DWORD BCD(d)	*See sample functions
BITSET	BITSET(P, b, w)	*See sample functions
CEIL	FLOAT CEIL(f)	Math.Ceiling(f) Function CEIL(f As Single) As Integer Dim ret As Integer = f If (ret < f) Then ret = ret + 1 Return ret End Function
COS	FLOAT COS(f)	Math.Cos(s)
DEG2RAD	FLOAD DEG2RAD(f)	Math.PI / 180.0 * f
EXP	FLOAT EXP(f)	Math.Exp(s)
FADD	FLOAT FADD(f1, f2)	f1 + f2

FCOMP	WORD FCOMP(f1, f2)	Function FCOMP(f1 As Single, f2 As Single) As Single
		If (f1 < f2) Then Return -1
		If (f1 > f2) Then Return 1
		Return 0
		End Function

FDIV	FLOAT FDIV(f1, f2)	(f1 / f2)
FSET	FLOAT FSET(d)	f = d
FSUB	FLOAD FSUB(f1, f2)	(f1 – f2)
FLOOR	FLOAT FLOOR(f)	Math.Floor(f) Function FLOOR(f As Single) As Integer Dim ret As Integer = f If (ret > f) Then ret = ret - 1 Return ret End Function
FMUL	FLOAT FMUL(f1, f2)	(f1 * f2)
LOG	FLOAT LOG(f)	Math.Log(f, Math.E)
LOG10	FLOAT LOG10(f)	Math.Log10(f)
POW	FLOAT POW(f1, f2)	Math.Pow(f1, f2)
RAD2DEG	FLOAT RAD2DEG(f)	180.0 / Math.PI * f
SIN	FLOAT SIN(f)	Math.Sin(f)
SQRT	FLOAT SQRT(f)	Math.Sqrt(f)
TAN	FLOAT TAN(f)	Math.Tan(f)

NS Macro Function	Argument and Return Value	NA VB Function and Expression
Operations of Memory, String, and Time		
LOCALTIME	WORD LOCALTIME(M1,M2)	Prepare the difference between the local time and UTC. A DateTime-type variable must include the difference. To use a value on a PT memory in another processing, you need to convert the value into a DateTime-type variable. If the data is handled in the DateTime-type in the NS unit, conversion is not necessary.
MEMCOPY	MEMCOPY(M1, M2, w)	*See sample functions
MEMSET	MEMSET(M, w1, w2)	*See sample functions
SETTIME	SETTIME(M)	SetDateTime() You must convert the original numeric data into a Date-type variable because a Date-type variable is required for argument.
STRCPY	STRCPY(M1, M2)	*See sample functions
STRCPYW	STRCPYW(M1, M2)	*See sample functions
STRM2W	STRM2W(M1, M2)	Difficult to substitute.
STRW2M	STRW2M(M1, M2)	Difficult to substitute.
SWAP		*See sample functions
SWAPL		*See sample functions
Operations of Screens and Objects		
CLOSEPOPW	CLOSEPOPW(PageNumber)	ClosePage(PageName)
GETNUMVAL	GETNUMVAL()	Difficult to realize.
GETPARTS	GETPARTS(n,Left,Top,Right,Bottom)	Difficult to realize.
MOVEPARTS	MOVEPARTS(n, X, Y)	Object's properties Left and Top represent the display coordinates of the object. Assign the arguments to them.
MOVEPOPW	MOVEPOPW(n, X, Y)	Difficult to substitute.
MOVEPOPWDOWN	MOVEPOPWDOWN(n, Y)	Difficult to substitute.
MOVEPOPWLEFT	MOVEPOPWLEFT(n, X)	Difficult to substitute.
MOVEPOPWRIGHT	MOVEPOPWRIGHT(n, X)	Difficult to substitute.
MOVEPOPWUP	MOVEPOPWUP(n Y)	Difficult to substitute.
MSGBOX	MSGBOX(message, title, iconType)	*See sample functions Microsoft.VisualBasic.MsgBox(message, [buttoNS,], [title,] [helpfile, context]) Note: To realize a corresponding setting to NS series argument iconType, use the argument "buttons" to set the button feature and displayed icon. Button feature is the same as the NS series, but the icon is different. The return value represents a push button. The combination of the push button and value is different.
RELEASEFOCUS	RELEASEFOCUS()	Moving the focus on a hidden DataEdit object will

NS Macro Function	Argument and Return Value	NA VB Function and Expression
		release the focus.
RSTALARMCNT	RSTALARMCNT(sw)	Difficult to substitute.
SETFOCUS	SETFOCUS(n)	SetInputFocus()
SHOWPAGE	SHOWPAGE(n)	_HMI_CurrentPageIndex = n
SHOWPAGEBCD	SHOWPAGEBCD(n)	_HMI_CurrentPageIndex = BCD(n) *Use the sample function for BCD(n).
External Memory and Interface		
READCF	READCF(D,n,"FNAME",Dev)	Difficult to substitute.
READCMEM	READCMEM(D, [a] ,w)	Difficult to substitute.
READHOSTB	READHOSTB(D,h,ch,addr,r,n)	Difficult to substitute.
READHOSTW	READHOSTW(D,h,ch,addr,r,n)	Difficult to substitute.
WRITECF	WRITECF(S,n,"FNAME",Dev)	Difficult to substitute.
WRITEMEM	WRITECMEM([a],S,n)	Difficult to substitute.
WRITEHOSTB	WRITEHOSTB(h,ch,addr,r,S,n)	Difficult to substitute.
WRITEHOSTW	WRITEHOSTW(h,ch,addr,r,S,n)	Difficult to substitute.

4-6-7 Sample Alternate Functions for NS Macro Functions

Among the NS series macro functions, some can be realized by VB programs even though they cannot be realized with existing library functions. Sample codes are shown below. The value range check for arguments is omitted, so please add code as necessary.

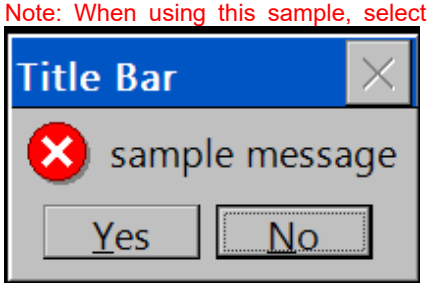
NS Function	Alternate Sample Function

BCD	Function BCD(ByVal iNum As ULong) As ULong
	Dim f1 As Boolean = False
	If (iNum < 0) Or (99999999L < iNum)
	Throw New ApplicationException("Out of range parameter on BCD()")
	End If
	REM Workaround for VAL function since an exception occurs in the ranges of 8000 to 9999 and 80000000 to 99999999.
	If (8000L<= iNum) And (iNum <= 9999)
	iNum = iNum + 10000
	f1 = True
	End If
	If (80000000L<= iNum) And (iNum <= 99999999L)
	iNum = iNum - 30000000L
	f2 = True
	End If
	Dim ret As ULong = Microsoft.VisualBasic.Val("&H" & iNum.ToString)
	If f1 Then ret = ret - 65536
	If f2 Then ret = ret + &H30000000L
	Return ret
	End Function

BIN	Function BIN(iNum As Integer) As Integer
	If (iNum < 0) Or (&H99999999L < iNum)
	Throw New ApplicationException("Out of range parameter on BIN()")
	End If
	Dim sNum As String = iNum.ToString("X")
	If Not Microsoft.VisualBasic.IsNumeric(sNum) Then Return 0
	Return Microsoft.VisualBasic.Val(sNum)
	End Function

BITSET	REM The 1st argument is the offset number of $B. Sub BITSET(m As UShort, b As UShort, w As UShort) Dim bv As Boolean = True If (0 = b) Then bv = False Dim ww As UShort For ww = 1 To w PTMEM_B(m) = bv m = m + 1 Next End Sub
MEMCOPY	Sub MEMCOPY(ByVal M1 As Integer, ByVal M2 As Integer, d As Integer) Dim n As Integer

NS Function	Alternate Sample Function
	For n = 1 to d PT_Memory_W(M2) = PT_Memory_W(M1) M1 = M1 + 1 M2 = M2 + 1 Next End Sub
MEMSET	Sub MEMCOPY(ByVal M1 As Integer, w1 As Integer, w2 As Integer) Dim n As Integer For n = 1 to w2 PT_Memory_W(M1) = w1 M1 = M1 + 1 Next End Sub

MSGBOX	Sub MSGBOX
	Dim msg As String
	Dim title As String
	Dim style As Microsoft.VisualBasic.MsgBoxStyle
	Dim response As Microsoft.VisualBasic.MsgBoxResult
	Dim Res1 As String
	
	msg = "sample message"
	style = Microsoft.VisualBasic.MsgBoxStyle.DefaultButton2 Or _
	Microsoft.VisualBasic.MsgBoxStyle.Critical Or _
	Microsoft.VisualBasic.MsgBoxStyle.YesNo
	title = "Title Bar"
	response = Microsoft.VisualBasic.MsgBox(msg, style, title)
	If response = Microsoft.VisualBasic.MsgBoxResult.Yes Then
	'Describe behavior when Yes button pressed
	Res1 = "Yes_Click"
	Else
	'Describe behavior when the button other than Yes pressed
	Res1 = "No_Click"
	End If
	End Sub
	
	Executing the above sample code displays this message box.
	Note: When using this sample, select English for the system language.
	 


STRCPY	Sub STRCOPY(ByVal M1 As Integer, M2 As Integer) Dim wd As UShort

NS Function	Alternate Sample Function
	Dim lp As Boolean = True Do While lp wd = PTMEM_W(M2) If 0 = (wd And &HFF00) wd = PTMEM_W(M1) And &hFF lp = False Else If 0 = (wd And &HFF) wd = wd And &hFF00 lp = False End If PTMEM_W(M1) = wd M1 = M1 + 1 M2 = M2 + 1 Loop End Sub
STRCPYW	Sub STRCOPY(ByVal M1 As Integer, M2 As Integer) While PTMEM_W(M2) <> 0 PTMEM_W(M1) = PTMEM_W(M2) M1 = M1 + 1 M2 = M2 + 1 End While PTMEM_W(M1) = 0 End Sub
SWAP	Sub SWAP(ByVal M As Integer, w As Integer) Dim n As Integer Dim wH As Integer Dim wL As Integer For n = 1 to w wH = (PT_Memory_W(M) >> 8) And &hFF wL = PT_Memory_W(M) And &HFF PT_Memory_W(M) = (wL << 8) Or wH M = M + 1 Next End Sub
SWAPL	Sub SWAPL(ByVal M As Integer, w As Integer) Dim n As Integer Dim ww As Integer For n = 1 to w ww = PT_Memory_W(M) PT_Memory_W(M) = PT_Memory_W(M+1) PT_Memory_W(M) = ww M = M + 2 Next End Sub

NS Function	Alternate Sample Function

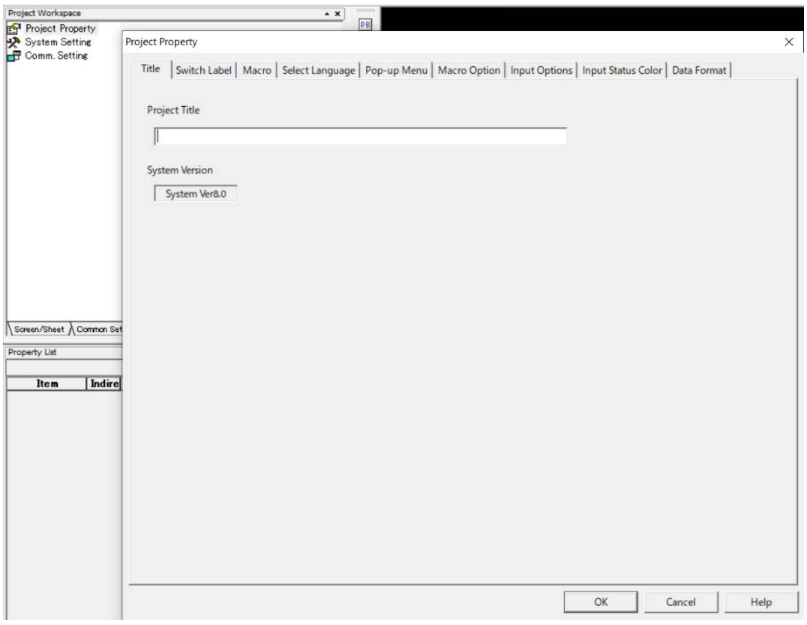
SETTIME	REM SetDateTime() does not work in a simulation.
	Sub SETTIME(M As Integer)
	  Dim DateString As String
	  Dim wYear As UShort = 2000 + (NS_Memory_W(M+2) And &HFF)
	  Dim wMonth As UShort = (NS_Memory_W(M+2) >> 8) And &HFF
	  Dim wDay As UShort = (NS_Memory_W(M+1) >>8) And &HFF
	  Dim wHour As UShort = (NS_Memory_W(M+1) And &HFF)
	  Dim wMinute As UShort = (NS_Memory_W(M) And &HFF)
	  Dim wSecond As UShort = (NS_Memory_W(M) >> 8) And &HFF
	  DateString = wYear.ToString() & "-" & wMonth.ToString() & "-" & wDay.ToString() _
	  & " " & wHour.ToString() & ":" & wMinute.ToString() & ":" + wSecond.ToString()
	  SetDateTime(Date.Parse(DateString))
	End Sub

5 Replacement Examples: Common Settings

This chapter describes the examples for replacing common settings such as project properties and system settings.

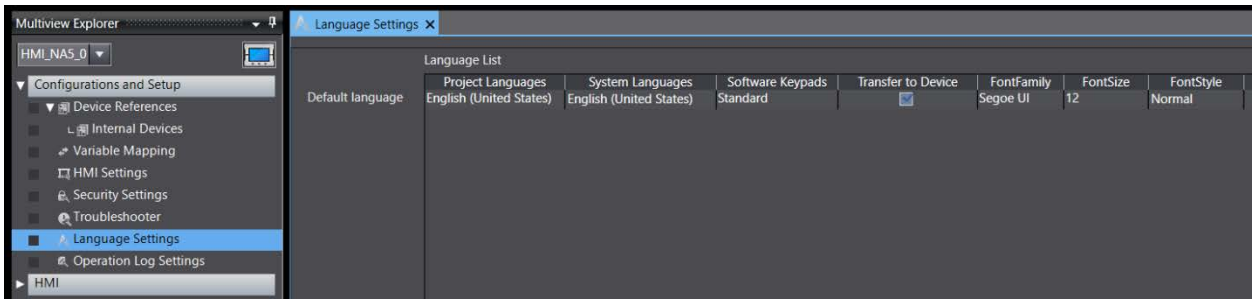
5-1 Project Properties

To show the Project Properties dialog box of an NS project, click **Project Properties** in Project Workspace window. The following sections describes replacement examples for each tab on the top of the dialog box.



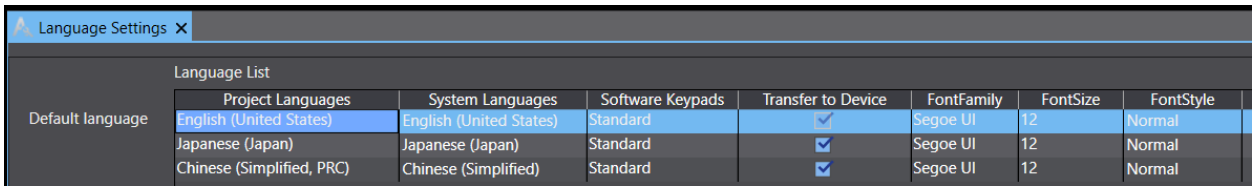
5-1-1 Switch Label Tab

Select **Configurations and Setup** - **Language Settings** to setup labels.



Every click on the  button increases a language. Click the button as many as languages you use.

Project Languages corresponds to **Label name** in the NS series.
You can also specify the system language and default fonts for each project language.
If you display characters that are not compatible with the specified font, such as displaying Kanji characters while specifying an English font, the display on Sysmac Studio and the display on the NA unit will not match. Therefore, specifying default fonts in this tab is useful.

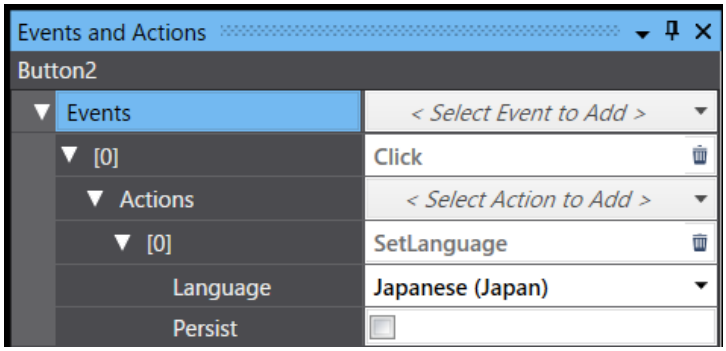


This table provides the recommended fonts for languages.

Language	Recommended Font Family
Japanese	Meiryo, MS Gothic
Simplified Chinese	Microsoft YaHei, SimSun
Traditional Chinese	Microsoft JhengHei, MingLiU
Korean	Malgun Gothic, Gulim, GulimChe

- Toggling Display Language During the Operation

In the NS series, changing the value of the system memory $SW10 enables to toggle the languages to display.
IN the NA series, select **SetLanguage** in **Events and Actions** to switch languages.

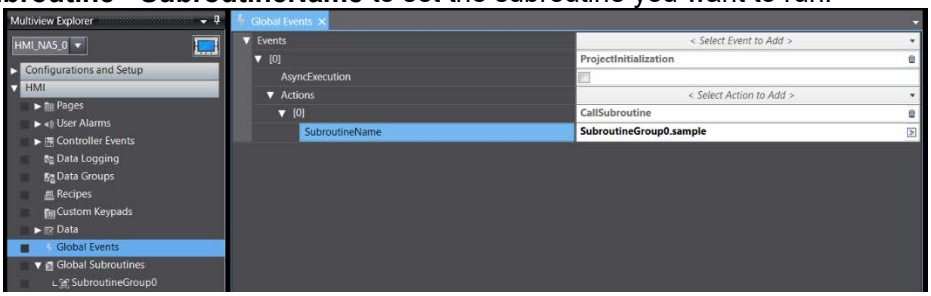


Or use SetLanguage function in a subroutine. In that case, you cannot specify an argument for the subroutine that is set in **Actions** in **Events and Actions**. Therefore, create a function without an argument and give an argument to SetLanguage function within the prepared function.
Refer to NA-series Subroutine Reference Manual for details of SetLanguage function.

5-1-2 Macro Tab

- When Loading a Project

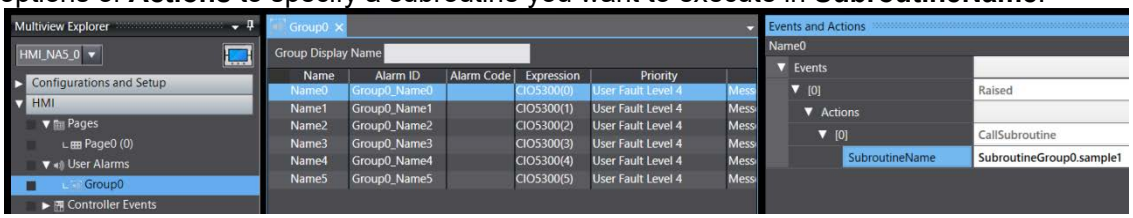
Select **HMI** - **Global Events**. Then, select **Events** - **ProjectInitialization**, and click **Actions** - **CallSubroutine** - **SubroutineName** to set the subroutine you want to run.



- On timing Alarm/Event occurred/On timing Alarm/Event is canceled

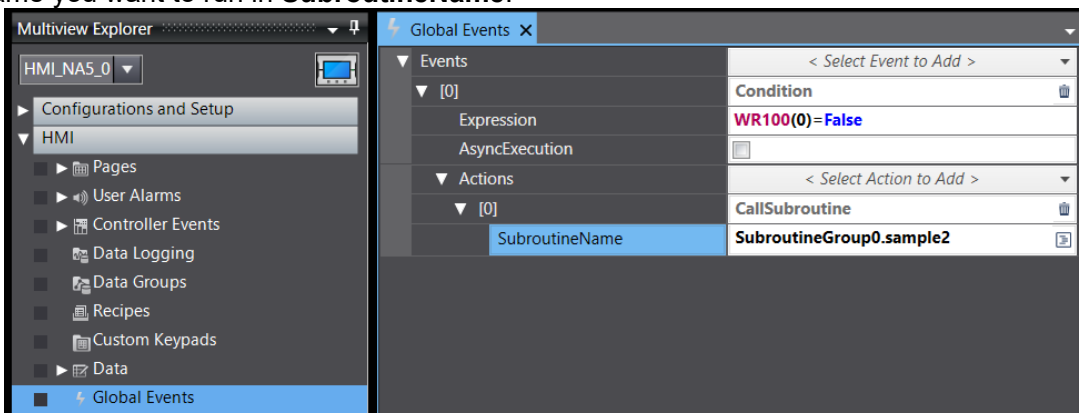
For the NS series, you can set macros for all alarm occurrences and cancels, but for the NA series, you need to configure for each alarm.

Click **HMI** - **User Alarms** to select an alarm which executes a subroutine. Then, select **Raised** or **Cleared** from the options of **Events**. And select **CallSubroutine** from the options of **Actions** to specify a subroutine you want to execute in **SubroutineName**.



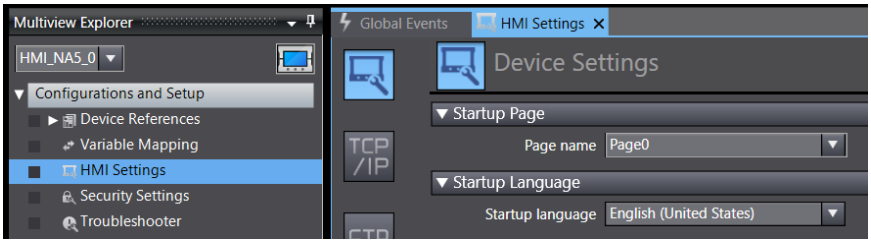
- When a bit changed

Click **HMI** - **Global Events**. Then select **Condition** from the options of **Events** to describe a condition in **Expression**. Then, click **Actions** - **CallSubroutine.** -Specify a subroutine's name you want to run in **SubroutineName**.



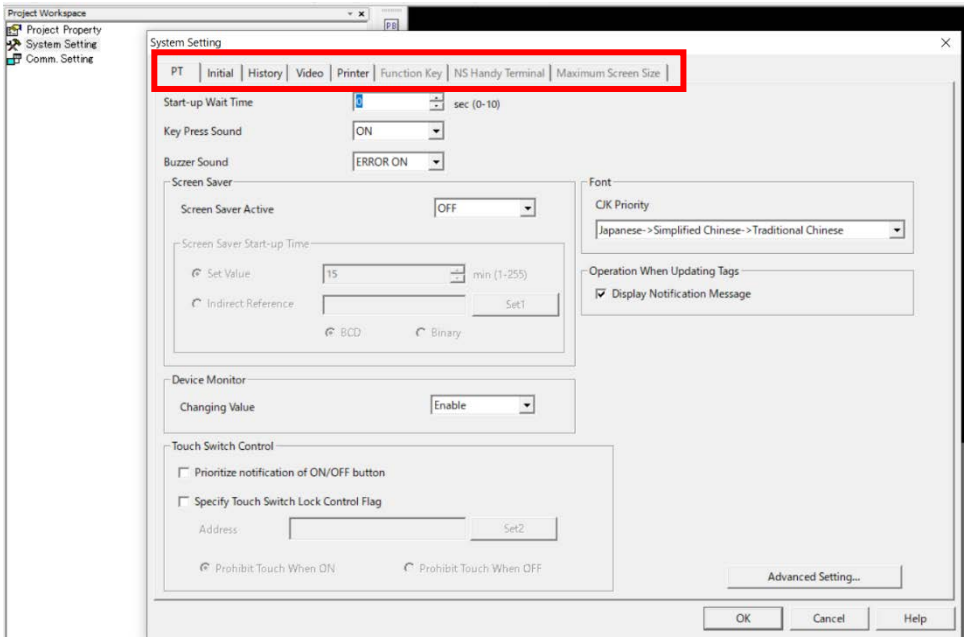
5-1-3 Language Selection Tab

NA system language depends on the currently running project's language.
Set an initial project language in **Configurations and Setup** - **Device Settings** - **Setup Language**.



5-2 System Setting

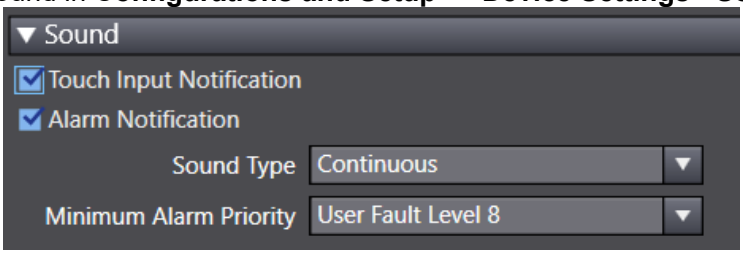
To show the System Setting dialog box of an NS project, click **System Setting** in the Project Workspace window. The following sections describes replacement examples for each tab on the top of the dialog box.



5-2-1 PT Tab

- Key Press Sound/ Buzzer Sound

Configure the sound in **Configurations and Setup - Device Settings - Sound**.

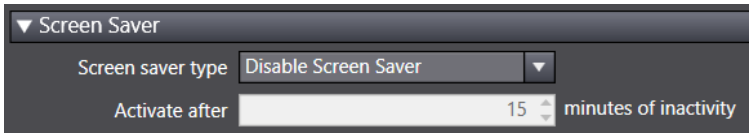


- Screen Saver

Configure a screen saver in **Configurations and Setup - Device Settings - Screen Saver**.

The screen saver activates in an NS unit after 255 minutes of inactivity at the maximum, but 60 minutes in an NA unit.

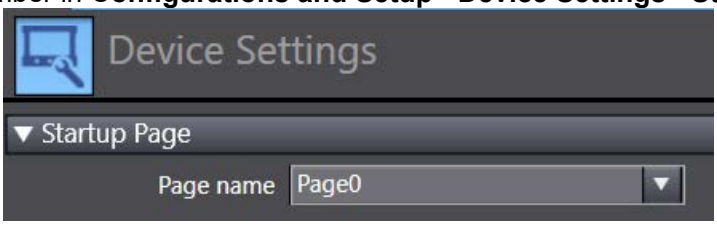
Also, NA units do not have the indirect reference of the wait time. You must specify a fixed value.



5-2-2 Initial Tab

- Initial Screen

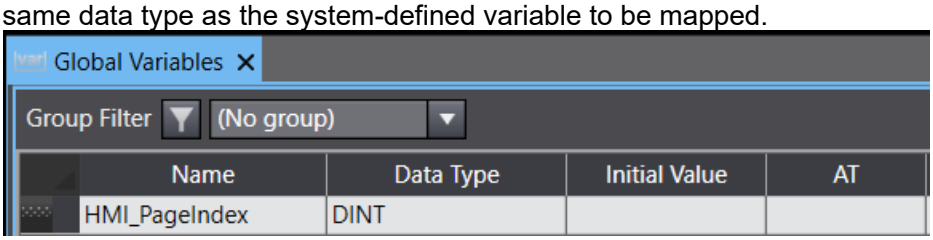
Set the page number in **Configurations and Setup - Device Settings - Startup Page**.



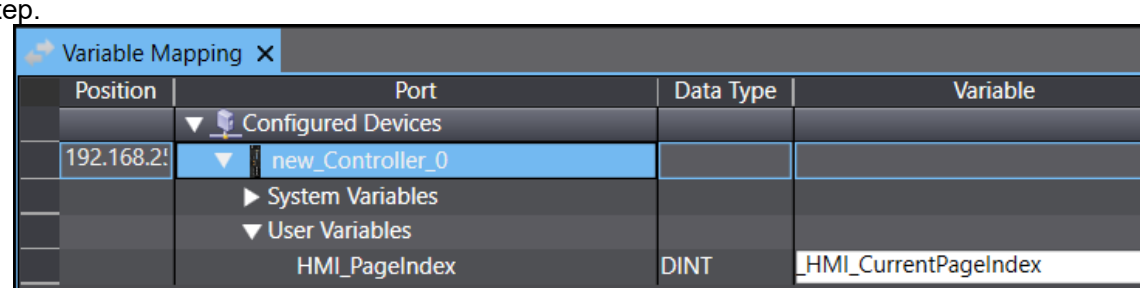
- System Memory

Add system-defined variables of the “Supported” items in the “System Memory” sheet in “Appendix 1: Project Common Settings” to Variable Mapping, following the procedure below.

1. Create a controller variable to be assigned to an NA system variable in the Controller side. Select the same data type as the system-defined variable to be mapped.



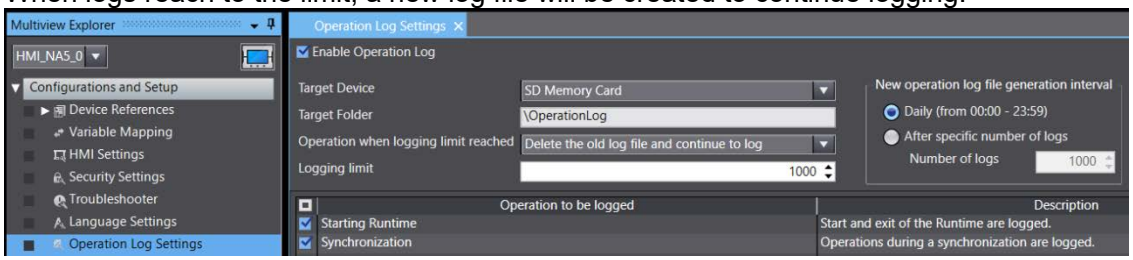
2. Move to the HMI side. Click **Configurations and Setup** − **Variable Mapping**. Manually enter a system-defined variable that is mapped to the controller variable created in the previous step.



5-2-3 History Tab

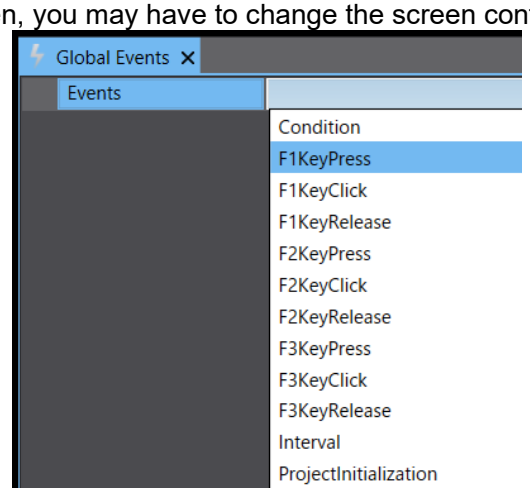
- Operation Log

Set the upper limit of logging in **Configurations and Setup**– **Operation Log Settings**. When logs reach to the limit, a new log file will be created to continue logging.



5-2-4 Function Key Tab (For NS15)

Click **HMI - Global Events**. In the Global Events tab, select **F1KeyPress** to **F3KeyRelease** from the options of **Events**. Then, select functionalities for each event from **Actions** to perform actions related to pressing and releasing keys. In NS15, function keys can only write addresses, bur in the NA series units, they can take screen shots and execute subroutines.
Because NA series units have fewer function keys than the NSH5, you must reassign actions to Touch Switches.
Also, while NS15 units have function keys on the left side of the screen, in the NA series units the function keys are located at the bottom of the screen. Therefore, if you use function keys in association with the screen, you may have to change the screen configuration.



5-3 Variable Table

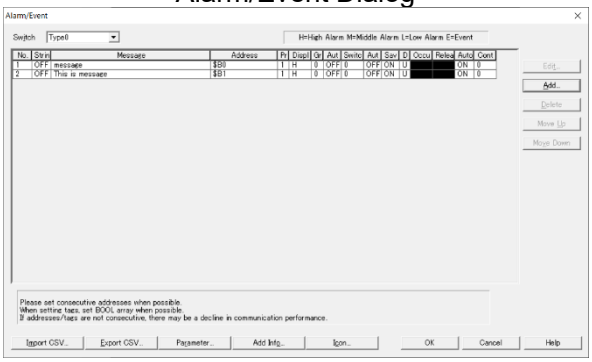
Import the variable table in an NS unit to the NA series variables.

Refer to “4-3-6 Specify Device Address of NS” to “4-3-9 Import NS Variable Table to NA Device Variables” for detailed import procedure.
For device addresses or variables set as “start address + number of monitor points” in the Broken-line Graph Group, only the start addresses will be imported. Follow the procedure in “5-6 Broken-line Graph Group Setting” to set correct arrays.

5-4 Alarm/ Event Settings

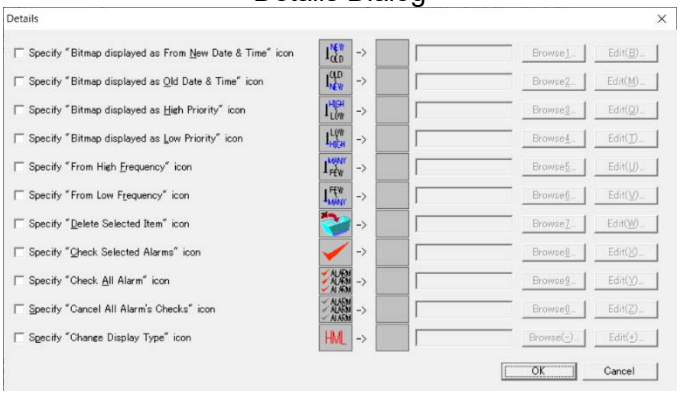
NS series Alarm/Event Settings consists of the Alarm/Event, Alarm/Event Details, Details, and Alarm/Event Parameter dialogs.

Alarm/Event Dialog

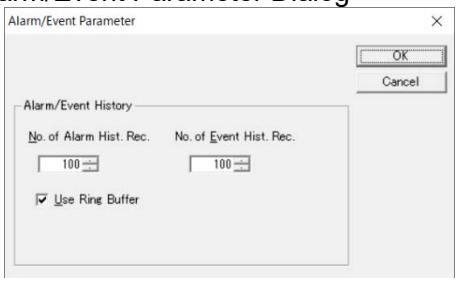


Alarm/Event Details Dialog

Details Dialog



Alarm/Event Parameter Dialog

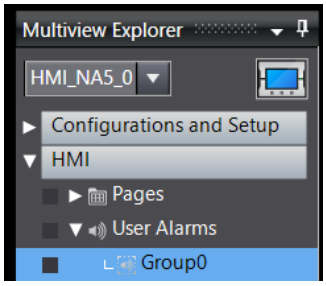


The table below provides the relation of NS and NA Alarm/Event settings.

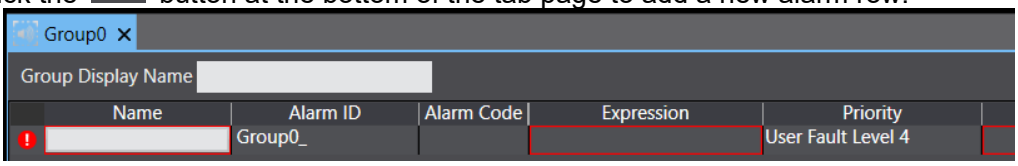
NS	Supported/Unsupported in NA	Remarks
Occurred Text	Partly supported	You can select the display color in a user alarms viewer object. Because the object uses the same colors in all alarms, you are not allowed to set display colors depending on each alarm, like for the NS series.
Released Text	Partly supported	
Message	Supported	
Address	Supported	Both rising and falling of a bit variable are supported.
Detection Type	Supported	
Priority	Partly supported	The NS series offers 9999 levels of priority, but in the NA series, 9 levels: User Fault Level 1 to 8 and User Information. The NA series has the narrower setting range, so use **Alarm Code** as compensation.
Display Type	Unsupported	No corresponding function
Group	Supported	The NS series registers groups by numbers 0 to 99, but the NA series group names are given by strings. There is the item **Group** in the alarm settings, but a user alarms viewer object cannot display only a designated group on the HMI screen.
Switch Screen	Partly supported	After selecting an alarm an performing the operation on the dialog box that appears, the displayed screen switches to the screen set for the alarm. Unlike the NS series, NA screens are not switched just after being selected on an alarm object.
Switch Contents	Unsupported	No corresponding function
Save to History	Partly supported	You cannot have the option not to save because the alarm and event history is mandatorily saved.
Delete when Alarm/Event is canceled	Partly supported	Alarms and events will be disappeared after cancellation.
Add Info	Partly supported	You can register up to 3 additional information in an entire project of the NS series. In the NA series, you can register 1 additional information for each alarm.
Icon	Partly supported	The NA series does not have dedicated icons such as the alarm/event summary and history object icons. Create processes corresponding to the original icons by using buttons and other objects. Note that some original icons cannot be realized.

5-4-1 How to Replace

1. Double-click **Group0** under **HMI − User Alarms** in Multiview Explorer.



2. Click the  button at the bottom of the tab page to add a new alarm row.



3. Make the settings for the added row following this table. Items not in the table are set to defaults.

Item	Setting
Name	The NS series does not have this item. Leaving this field blank causes an error, so entering a name is required. Names must be unique.
Alarm Code	If you are filtering alarms by group in NS, enter a value of the group name in this field. This item can perform as the alternate functionality for display filtering by group, which is not supported by the NA series. Leave this field empty if you are not using the filtering by group.
Expression	Enter a variable name that corresponds to the original address. When the Detection Type is “Up”, enter the variable name, and for “Down,” enter “variable name = False.”
Priority	Select from the 9 options of User Fault Level 1 to 8 and User Information. As mentioned before, since the setting range in the NA series is narrower than the NS series, you need to re-asses the priority if you have set 10 levels or more for your NS.
Message	Set a message. You can set the message here in the default language only. If you want to set in more than one language, you need to make the setting in **HMI - Resources - Alarm Strings**.
Popup	Uncheck the box.
Acknowledge	Check this box only if you need confirmation of alarm display.
Page	Enter a name of the destination page if selecting the alarm switches the currently displayed page. If the original project does not include the page switching action, leave this field empty.

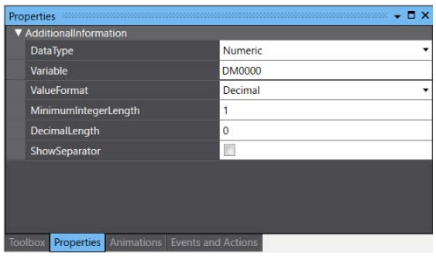
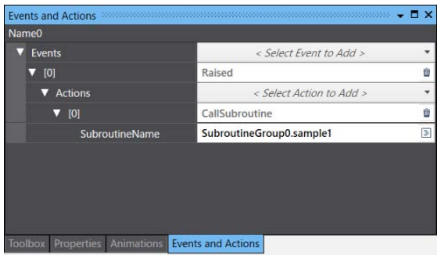
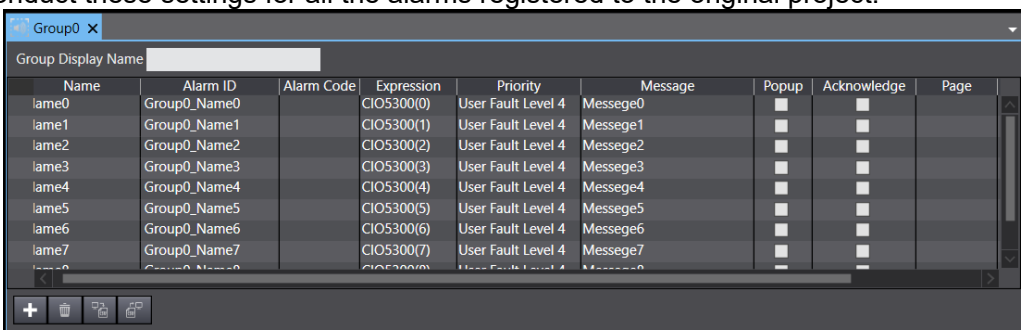
4. Configure **AdditionalInformation** in the **Properties** tab.
Click **Events** in the **Events and Actions** tab page. You can set actions for the events, **Acknowledged**, **Cleared**, and **Raised**. The following example shows the setting of CallSubroutine.
Make settings as required.



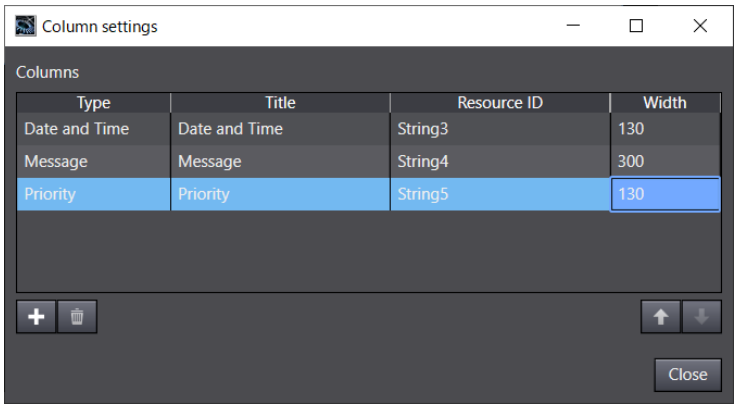


5. Conduct these settings for all the alarms registered to the original project.

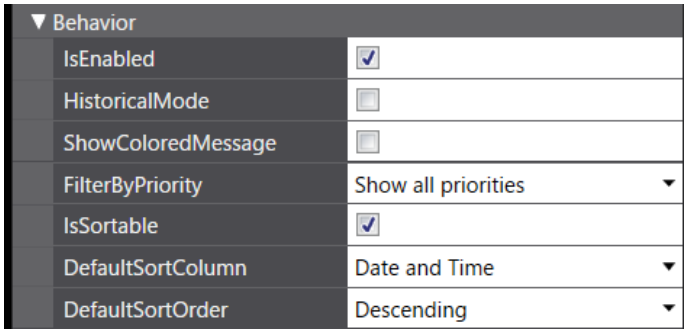


It is possible to export the alarm setting data to an Excel file, edit the file, and import the edited data.
The second icon from the right exports the setting data , and the rightmost icon imports.

6. Put a user alarms viewer object on the page, then configure the displayed column in **Properties** - **Appearance** - **Column**.



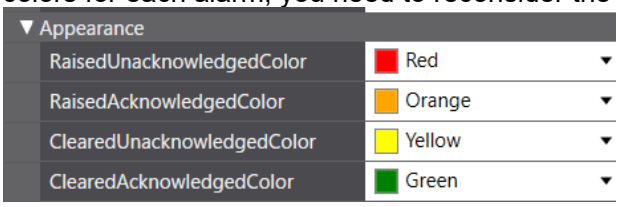
7. You can configure **DefaultSortColumn** and **DefaultSortOrder** in **Behavior** in the **Property** tab.
Checking **HistoricalMode** displays the **Alarm History** data, and unchecking displays the **Currently Occurred Alarms** data.



5-4-2 Non-replaceable Functionalities

- Occurred Text/ Released Text

For the NA series, you can set text colors for each state such as occurrence or release, and those colors are common with all the alarms shown on Alarm Objects. It is not allowed to set different colors for each alarm in the same manner as the NS series. If you are designating different colors for each alarm, you need to reconsider the text colors.



- Priority with 10 or more levels

9999 levels are available in the alarm priority in the NS series, but 9 levels in the NA series. If you have set 10 levels or more for your NS unit, reconsider the priority.

- Display Type

The NA series does not have a corresponding setting. In addition to fewer priority levels, the NA series does not provide a minute data classification as compared to the NS series. To display a specific type only, classify the display data by priority, group, or alarm code, and then, filter the data.

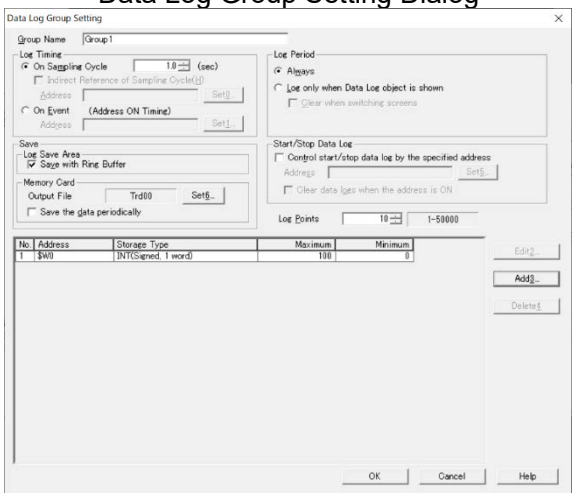
- Additional Information (More Than One)

The NS series allows you to register up to three additional information messages, display and record a designated address's value when an alarm rises.
However, you can set only one additional information message in the NA series. If you have set more than one additional information message in your NS unit, you must delete the information other than the top-priority one.

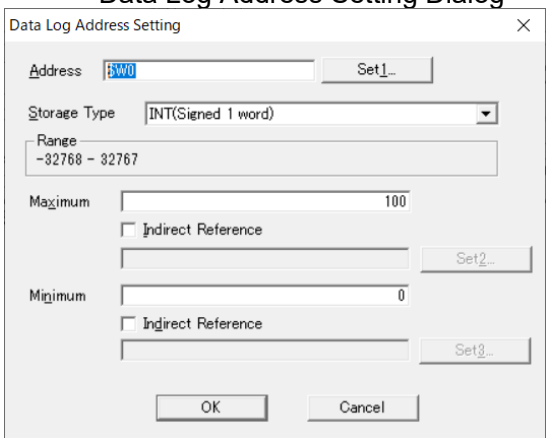
5-5 Data Log Settings

NS series Data Log Settings consists of the Data Log Group Setting and Data Log Address Setting dialogs.

Data Log Group Setting Dialog



Data Log Address Setting Dialog

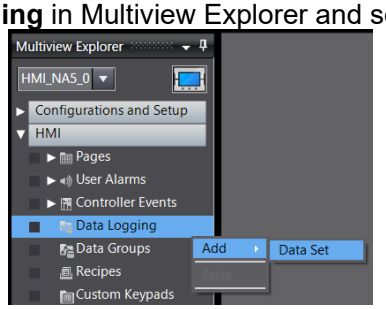


The table below provides the relation of NS and NA data log settings.

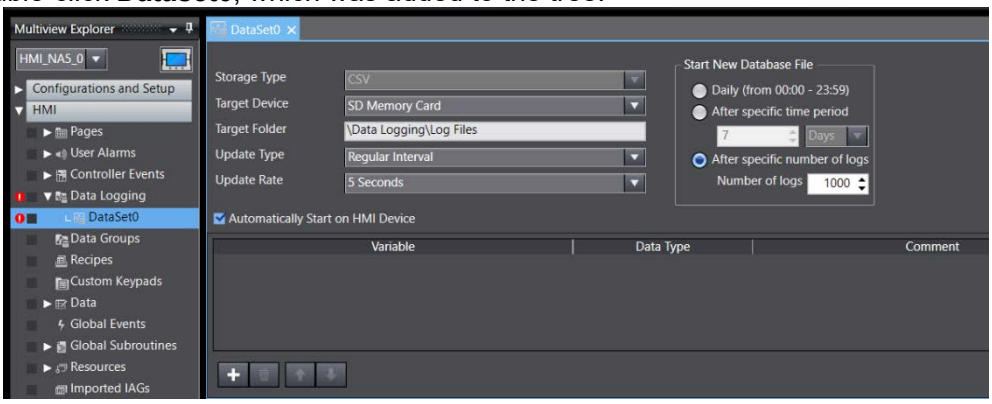
NS		Supported/Unsupported in NA	Remarks
Data Log Group	Log Timing	Partly supported	Indirect reference of sampling cycle is not supported.
	Save	Partly supported	The NA series units create a new file automatically to continue logging when the number of logs reach a set limit.
	Memory Card	Partly supported	You can specify a device where you save the data but not a file name. The file will be named automatically based on the date and time of file creation.
	Log Period	Unsupported	Data logging is not available only while an object is being displayed.
	Start/Stop Data Log	Partly supported	ON and OFF of an address (variable) can control starting and stopping logging, but not clearing logs when the address is ON.
	Log Points	Partly supported	The NA series units create a new file automatically to continue logging when the number of logs reach a set limit. Therefore, you cannot set your NA unit to stop logging when logs reach the specified limit. A real logging limit is the maximum capacity of an external memory designated as storage.
Data Log Address Setting	Maximum/ Minimum	Partly supported	You can set the maximum and minimum values with fixed values only. Indirect reference is not available.

5-5-1 How to Replace

1. Right-click **HMI** - **Data Logging** in Multiview Explorer and select **Add** - **Data Set**.



2. Double-click **Dataset0**, which was added to the tree.

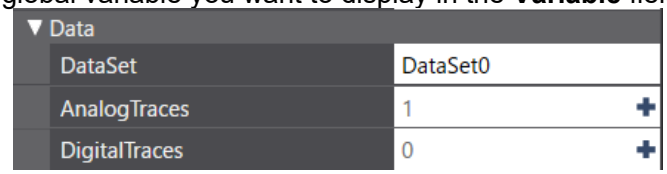


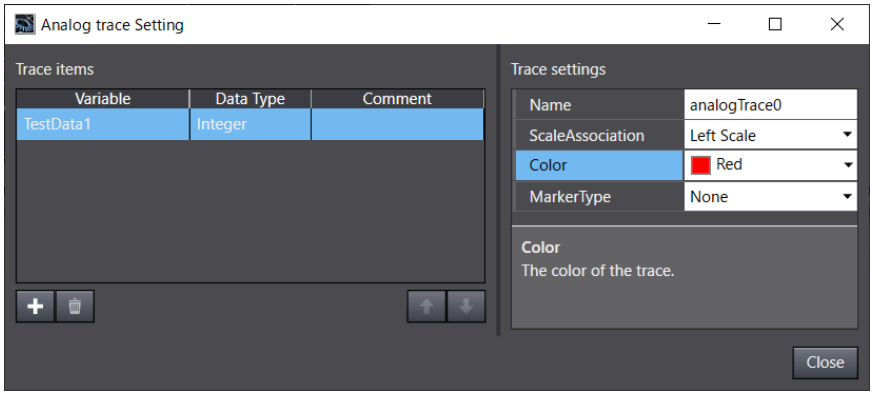
3. Conduct the following settings.

Item	Setting
Target Device	Select either of the SD card or USB stick memory to save logs.
Target Folder	Specify the folder to save log files. The files will be named automatically based on the date and time of file creation.
Update Type	Regular Interval: Logs are saved regularly. On Condition: Logs are saved by condition with variables.
Update Rate	Logs are saved at a fixed interval configured in this field. Indirect reference supported by the NS series is not available. You can use fixed values only.
Expression	Logs are saved when a condition expression in this field is met.
Start New Database File	Specifies the conditions for generating new log files.
Automatically Start on HMI Device	Checking this box saves logs automatically when you boot up the HMI. If you uncheck it, logs will not be saved unless you perform an action to start saving logs.
Variable	Specify global variables to log. Data types and comments are displayed automatically for the specified global variables.

4. After setting the data logging, add a Trend Graph Object on the page.

Select **Data** - **Data Set** in the Properties tab and specify the data group name you have created in the previous step for **Data Set**.
Then, click the ✚ button in the **AnalogTraces** or **DigitalTraces** field to open the trace setting dialog. Enter the global variable you want to display in the **Variable** field.



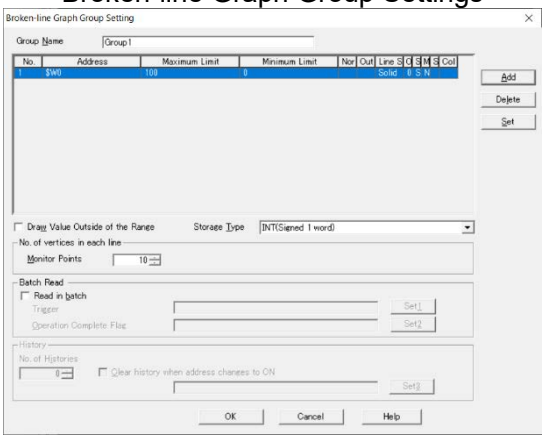


5. Configure settings of line, scale, and other items for each axis.

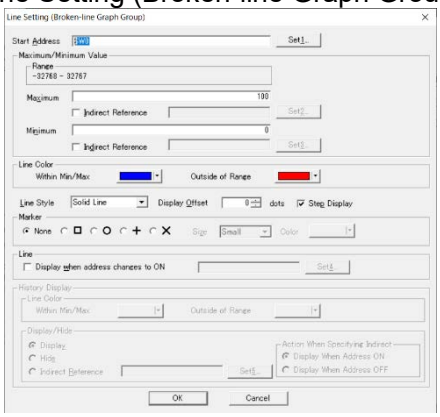
5-6 Broken-line Graph Group Settings

NS series Broken-line Graph Settings consists of the Broken-line Graph Group Setting and Line Setting dialogs.

Broken-line Graph Group Settings



Line Setting (Broken-line Graph Group)



In the NA series, the setting that DataSeries of DataGroup is set to *Array* is the corresponding feature.
The NS series broken-line graph settings include settings related to graph drawing, e.g., line color. However, in the NA series, the DataGroup setting has setting items for global variables and data type only, and those for graph drawing are in Properties of a broken-line graph object.
Therefore, this section describes not only settings of a data group but broken-line graph object and variable settings.

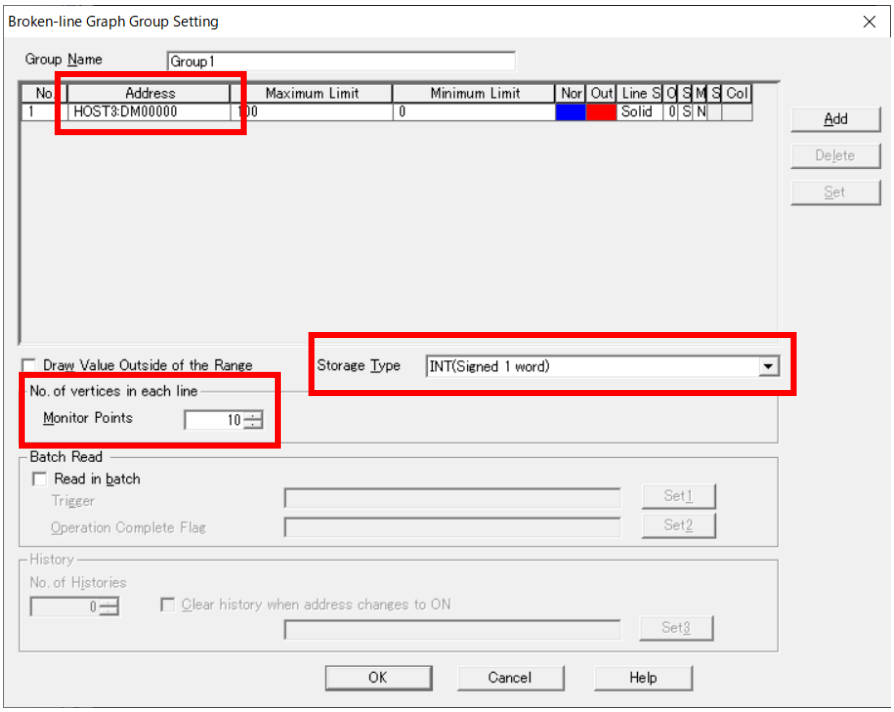
5-6-1 Functionality Correspondence Table

The table below provides the relation of NS and NA Broken-line graph settings.

NS		Supported/Unsupported in NA	Location	Remarks
Broken-line Graph Group	Draw Value Outside of the Range	Not supported	-	Values outside of the range are not displayed.
	Read in Batch	Not supported		Always reads values in batch.
	History	Not supported		You cannot save the broken-line graph history.
	Storage Type	Supported	Global Variables and Device Variables	Select a correct variable type when defining an array, according to the storage format.
	Monitor Points	Partly supported		The NS series units can monitor up to 1000 points, but the NA series units can monitor 800. To monitor the 801st point and more, modify the offset, which determines the beginning of monitoring, in **Data** - **Offset** of the broken-line graph object.
Line Setting	Start Address	Partly supported		Set an array that has as many as the monitor points of the start address.
			DataGroup	Add the registered array to **Data Series** in DataGroup tab.
	Line Setting: Maximum/Minimum Value	Partly supported	Broken-line graph object	Only fixed values are available for the maximum and minimum values. Indirect reference is not supported.
	Line Setting: Line Color	Partly supported		Only colors for **Within** supported. You cannot use colors out of the range.
	Line Setting: Line Style	Partly supported		The NA series supports solid line only. Dash line and dot line are not supported. Step display is not supported.
	Line Setting: Line	Supported		This item is not available. You can control displaying/hiding a line with a subroutine. To hide the line, use HideTraceInGraph function, and use ShowTraceInGraph function to show the line.

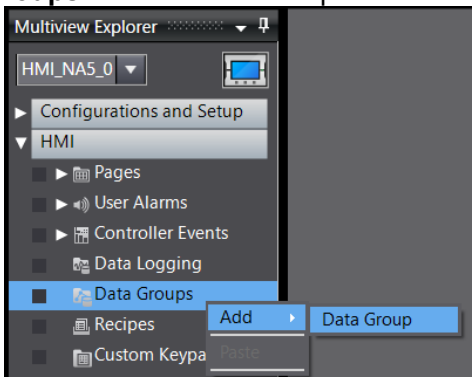
5-6-2 How to Replace

1. Register arrays in the global and device variables, respectively, according to the setting of the start address of the NS series Broken-line Graph Group.

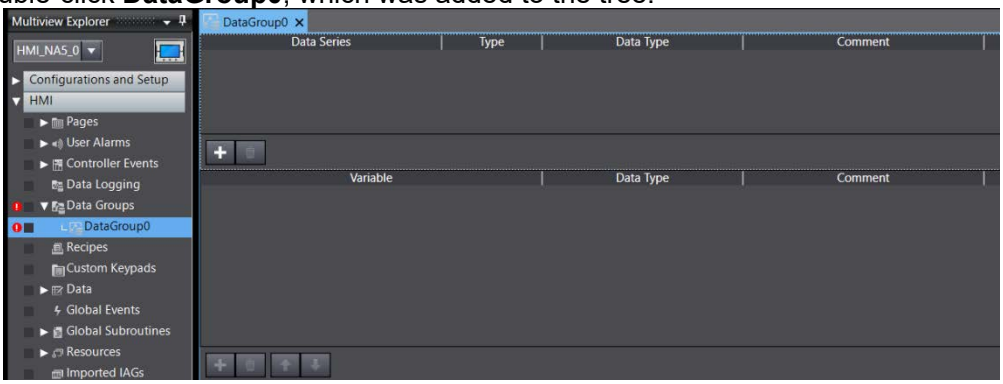


- PT Internal Memory
  ① Double-click **Global Variables** under **HMI** to open the Global Variables edit pane.
  ② Select **New** from the right-click menu. Enter any variable name. The variable's data type must correspond to the **Storage Type** of the NS series Broken-line Graph Group, and the variable must have as many elements as **Monitor Points**.
- Device Address
  ① Follow the same steps as 1) and 2) in "PT Internal Memory."
  ② Select the added array and open the right-click menu. Then select **Register To Controller**. A dialog box that allows you to associate a global variable and device variable appears.
  ③ Select a device from the **Device** drop-down list in **Controller Variable Details**. Then press the **Add Global Variable** button.
- Variable
  ① Only the start address is registered as variable.
  If the variable is used outside of the Broken-line Graph Group Setting, copy and paste the variable and use the added variable in the Data Group Setting.
  ② Select **HMI** - **Global Variables**. Choose the target variable on the edit pane, then set the variable's data type to the corresponding type to the **Storage Type** of the NS series Broken-line Graph Group, and the variable must have as many elements as **Monitor Points**.
- Tag
  It is not necessary to register a variable.

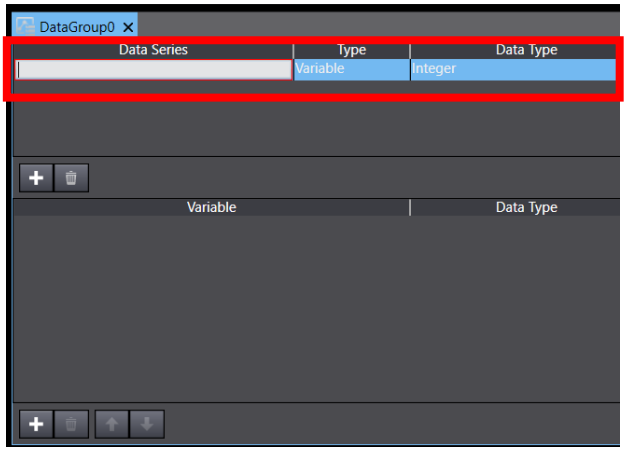
2. Right-click **HMI** - **Data Groups** in the Multiview Explorer and select **Add** - **Data Group**.



3. Double-click **DataGroup0**, which was added to the tree.



4. Click the  button to create a new data series.



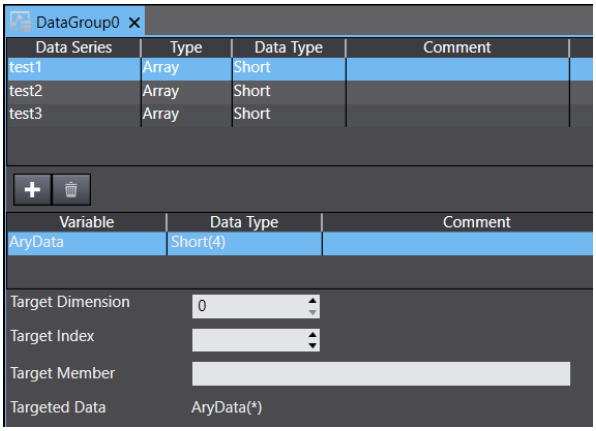
5. Configure the following for the data series.

One graph line is drawn per data series, so create as many data series as you want to display on a single graph.

Item	Setting
Data Series	Enter any name.
Type	Select *Array*.
Data Type	Select the variable type corresponding to the storage type of the NS-line Graph Group Setting.

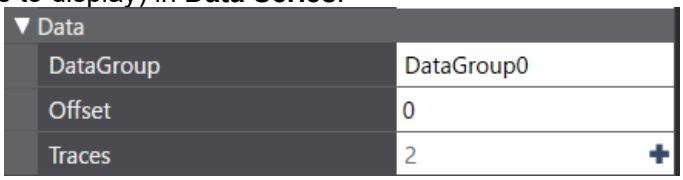
6. Configure attributes of the data series.

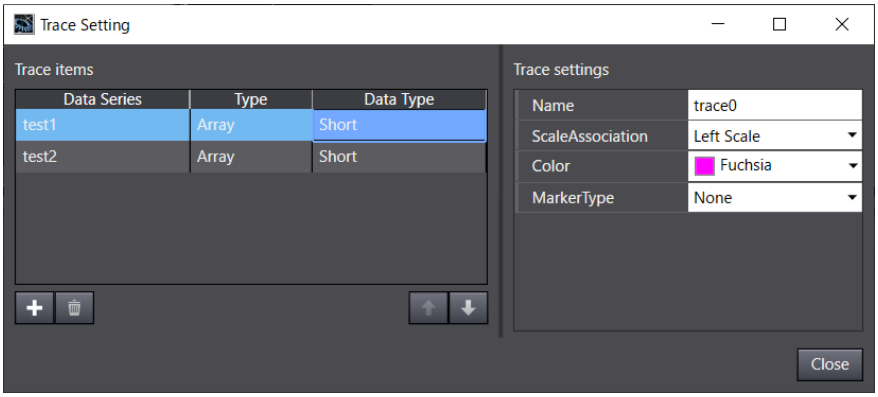
Item	Setting
Variable DataType	Specify an array to display. The **Data Type** field will be automatically filled depending on the array that was specified in the variable setting.
Target Dimension	Default value of *0*.
Target Index	This field is used for a multidimensional array only. Set the first index of the target. If you use a 1D array, leave this field blank, the default.
Target Member	This field is used for a structure array only. Enter the member names.



7. Add the broken-line graph object on the page.

Enter the name of the data group you have created in **DataGroup** under **Data** in the Properties tab.
Then, click the button in the **Traces** field to open the Trace Setting window. Enter the data series name (= line to display) in **Data Series**.





8. Configure settings of line, scale, and other items for each axis.

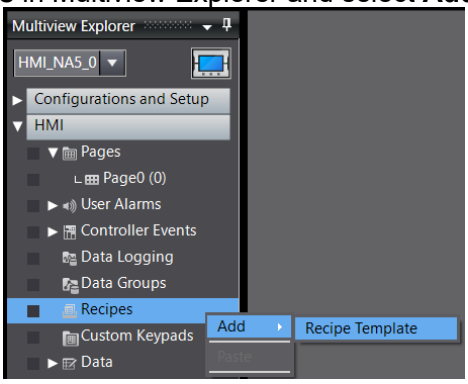
5-7 Data Block Settings

You can replace Data Blocks with Recipes.
However, settings and features are quite different.

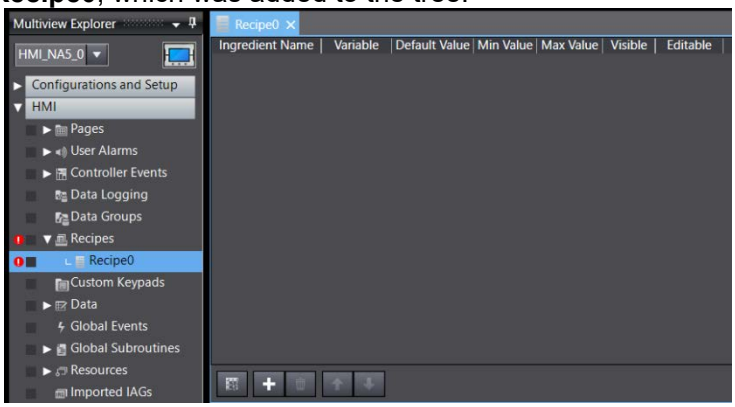
NS	Supported/Unsupported in NA	Remarks
Record Setting	Partly supported	You can set the number of maximum records only.
Specify Interlock	Not supported	Input interlock with variable conditions is not possible.
Record Label Setting	Not supported	Character code setting is not available.
Field Name	Supported	
Address	Supported	
Data Format	Supported	The data types of registered variables are automatically applied.
Record Label	Supported	
Recipe Data	Supported	

5-7-1 How to Replace

1. Right-click **HMI** - **Recipes** in Multiview Explorer and select **Add** - **Recipe Template**.

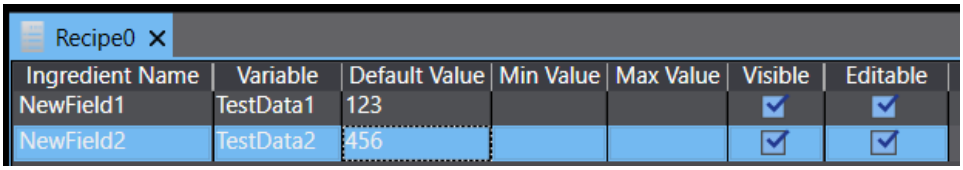


2. Double-click **Recipe0**, which was added to the tree.



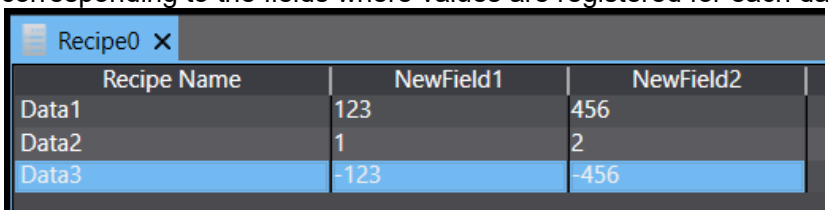
3. Click the button to add a field. Then configure the settings.

Field Name and **Address** of an NS series data block are corresponding to **Ingredient Name** and **Variable**, respectively.



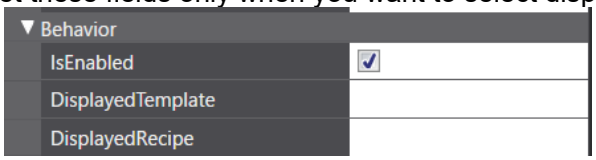
4. Click the button to register values for recipes.

These are corresponding to the fields where values are registered for each data block record.



5. Add a recipe viewer object on the page.

To display all registered recipes, leave the fields **DisplayedTemplate** and **DisplayedRecipe** blank, the default. Set these fields only when you want to select display items.



6. Configure the background color, text, and other settings.

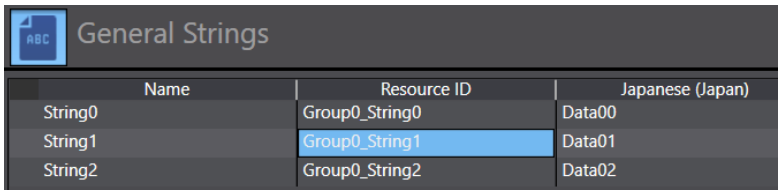
5-8 String Table Setting

You can replace the String Table Setting with **Resources** in **HMI**.

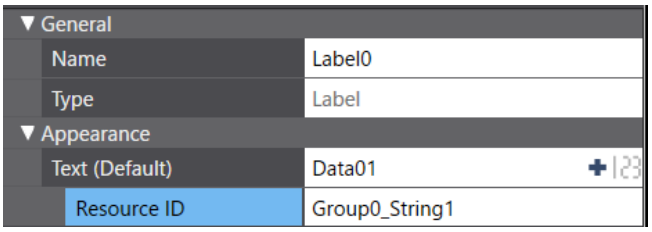
While the NA series has one string table per language, the NA series has five string groups, including General Strings, Alarm Strings, Images, and others.
Use General Strings, Alarm Strings, and Images for replacement of the NS series.

In the NS series, a string table is applied to alarm/event strings, whereas in the NA series, **Alarm Strings** in **Resources** is applied.

In addition, the NS series manages strings by string number in the string table, whereas the NA series manages by resource ID.



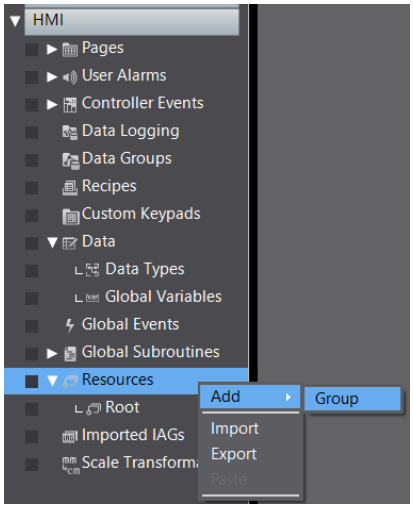
Enter the ID registered in **Resources** into **Resource ID** of the object to display the string registered in **Resources**.



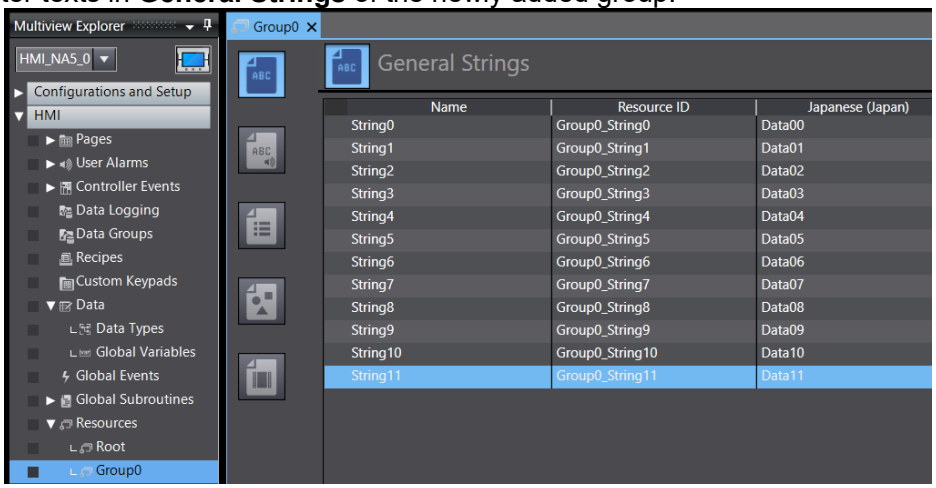
5-8-1 Example of Indirect Reference

You can specify Resource IDs for label and text box objects using conditional expressions. In this way, you can achieve the similar behavior as if the string number were set to Indirect Reference in the NS series.

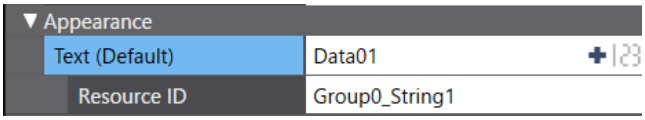
1. Right-click **HMI - Resources** in Multiview Explorer and select **Add - Group**.
   The group Root exits by default, but we recommend creating a new group for management reason.



2. Register texts in **General Strings** of the newly added group.

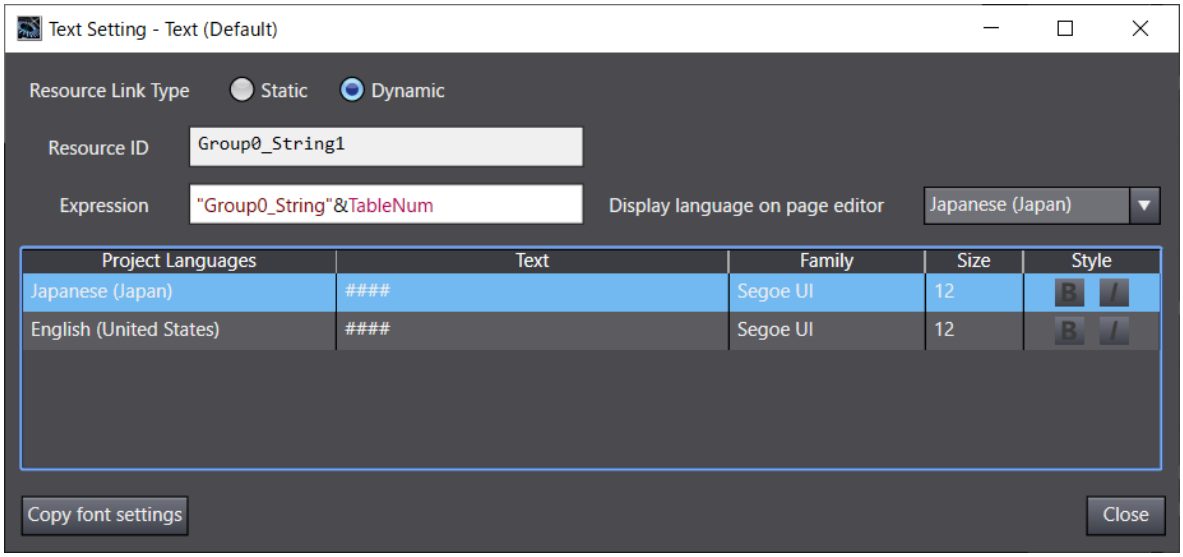


3. After completing entering the texts, create a label or text box object. Then click the button.



4. Selecting *Dynamic* for **Resource Link Type** allows you to enter in the **Expression** field.

Enclose the part to be fixed in double quotation marks, followed by & and then a numeric-type variable.
In the example show below, up to Group0_String is fixed, and the string can be switched according to the value of the numeric-type variable TableNum.



5-9 Password

The password function of the NS series allows you to enter a password to operate a functional object and has up to five passwords and operation levels.
For the NA series, the security function is available. This function controls whether an entry to an object is allowed/prohibited and whether the object is shown/hidden, depending on the privilege of the logged-in user. In the NA series, instead of entering a password at the time of operating the object as in the NS series, the user logs in with a username and password before operating the object.

To enter the password at the point of operating an object as in the NS series, follow this procedure.

1. Define five String type variables, NS_passwords1 to NS_passwords5, to store the password string as global variables.
2. Specify the passwords for NS as initial values of the password variables NS_passwords1 to NS_passwords5.
3. In addition, define Boolean type variables NS_SB54 to 58, which are substituted for the NS system memories $SB54 to 58 and Integer type variable NS_SW39, which is substituted for $SW39, as global variables.
4. Create a Qwerty keypad with the Custom Keypads menu. Add the code below to a page subroutine of the created keypad.

```
Sub NS_checkPassword()
  Dim lvl As Integer = 0
  Dim pwd As String
  pwd = Microsoft.VisualBasic.InputBox("Enter the password")
  select pwd
  case NS_passwords1:
    lvl = 1
  case NS_passwords2:
    lvl = 2
  case NS_passwords3:
    lvl = 3
  case NS_passwords4:
    lvl = 4
  case NS_passwords5:
    lvl = 5
  End Select
  If lvl > 0
    NS_SW39 = lvl
    NS_SB54 = True
  End if
 If lvl > 1 Then NS_SB55 = True
 If lvl > 2 Then NS_SB56 = True
 If lvl > 3 Then NS_SB57 = True
 If lvl > 4 Then NS_SB58 = True
End Sub
```

5. Edit the subroutine Enter in the page subroutine of the keypad you have created as the following.

```
Protected Overrides Sub Enter()
  If Not Me.ProcessKey(System.Windows.Forms.Keys.Return)
    Dim valid As Boolean = True
    Dim text = String.Empty
    text = Me.GetText()
    Try
      Me.ValidateTextValue(text)
      Me.Value = text
    Catch ex As System.Exception
      Me.TextValidation.IsVisible = True
      valid = False
    End Try

    If valid = True Then
   CheckPassword(Me.Value)
   MyBase.Cancel()
    End If
  End If
End Sub
```

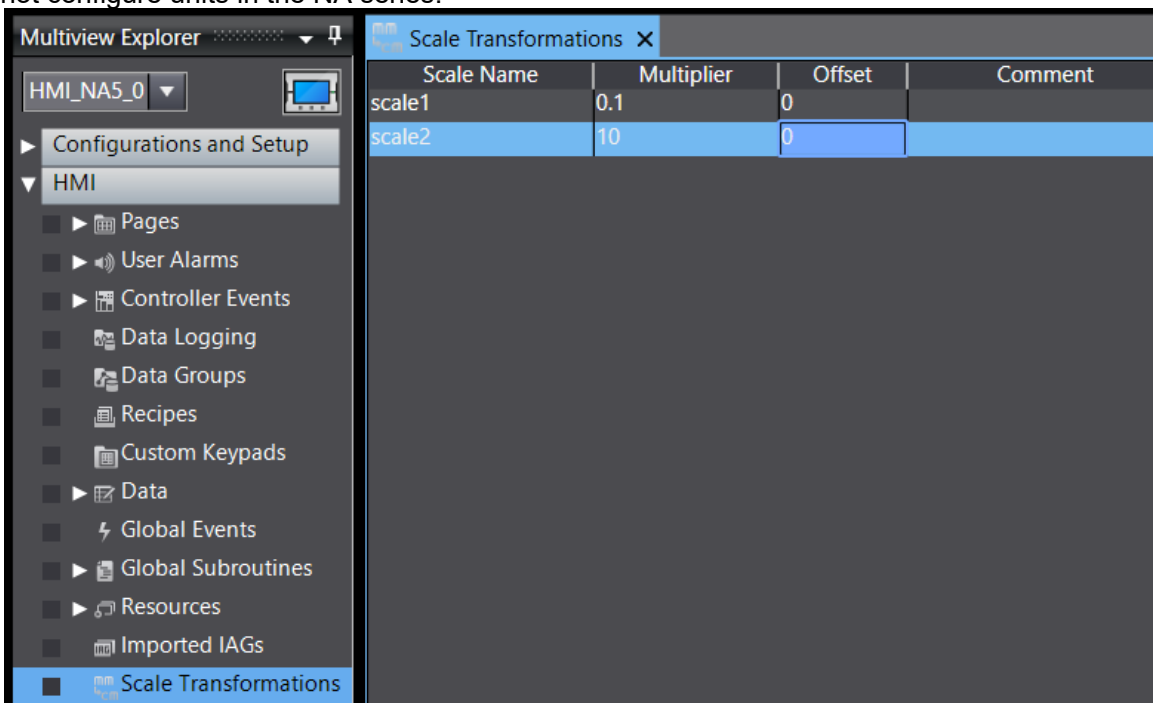
6. Add the following subroutine to a screen that contains a password-requiring part object.
7. Add an event that executes the subroutine *NS_check_Password* in the Events and Actions pane for the part object.
   Note: The last argument for EditVariable in the second line of the following subroutine must be the name of the added keypad.
   Edit the name tailoring to the set custom keypad group name.

```
Sub NS_checkPassword()
  EditVariable("dummy", "Enter your password.", , , , ,True ,"QWERTYKEYPAD" , ," Group0")
End Sub
```

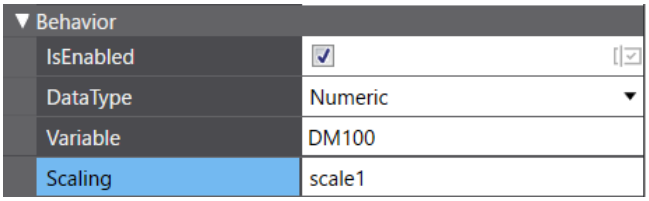
After the password is successfully verified, the corresponding level variable turns TRUE. Confirm it and then, add an NS processing such as screen switching in Events and Actions.

5-10 Unit/Scale Settings

Double-click **Scale Transformations** under **HMI** in Multiview Explorer to open the **Scale Transformations** edit pane. Configure multiplier and offset values. Unlike in the NS series, you cannot configure units in the NA series.



Enter the registered scale transformations in the **Scaling** field in Properties of a data display or data input object.



5-11 Dialog Setting

The NA series does not have a corresponding functionality.
To realize the same behaviors as the NS series, you need to utilize pup-ups.

Since the NA series can only display one pop-up screen at a time, the following method is useful to display additional confirmation dialog, etc. on the pop-up.

1. Place a button object the same size as the screen size at the very front of the page. Make inputs disabled on this button object. By hiding this button object normally and making the object visible when displaying the confirmation dialog, the currently displayed window will be covered by this object, and all buttons there will get non-enterable.
2. Arrange objects for the confirmation dialog in front of the button object. These objects should also be normally hidden so that they will be displayed and operated when the confirmation dialog is displayed.

5-12 Device Data Transfer Setting

The NA series does not have a corresponding functionality.
The following describes how to achieve the function with a subroutine.

1. Define transfer source address and transfer destination address of a transfer entry in Global Variables. If the transfer entry has more than one data element, define as an array with as many members as the elements.
2. Define the bit address of a device data transfer trigger as a Boolean variable in Global Variables.
3. Create a function NS_DataTransfer in Global Subroutines. You need as many functions as device data transfer triggers.

```
Sub NS_DataTraNSfer1
   Dim I As Integer
   DestinationVariable1 = SourceVariable1
   DestinationVariable2 = SourceVariable2
   DestinationVariable3 = SourceVariable3
   ...
   For I = 0 To SourceArray4.Length – 1
      DestinationArray4(i) = SourceArray4(i)
   Next
   For I = 0 To SourceArray5.Length – 1
      DestinationArray5(i) = SourceArray5(i)
   Next
   ...
End Sub
```

4. Register the data transfer triggers in Global Events.
   Events must be the same number of triggers, and you need to specify corresponding functions for them.

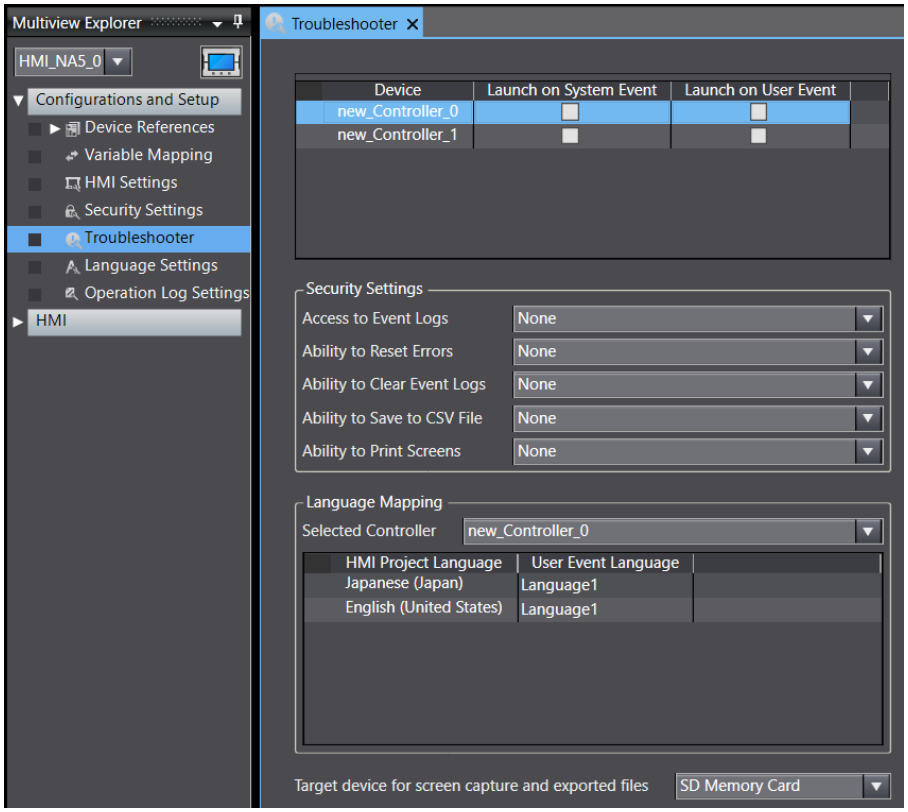
Trigger Type	Event	Action
Rising Edge	Enter *Variable* in **Condition** - **Expression** Specify the function *NS_DataTraansfer*** in **CallSubroutine**	
Falling Edge	Enter *Not Variable* in **Condition** - **Expression**	
Cycle	Select *Interval* in **Interval**.	

5-13 Troubleshooter Setting

The table below provides the relation of NS and NA troubleshooter settings.

NS	Supported/Unsupported in NA	Remarks
Screen Setting	Partly supported	While in the NS series, you need to copy the screen settings from Sysmac Studio or import via a CSV file, in the NA series, you can reuse events set in the controller, cooperating in Sysmac Studio. However, you cannot display a screen you want to show while pressing the Show Detail button.
Theme	Not supported	The theme to be displayed is fixed.
Language Assignment	Supported	Configure the language assignment in the **Language Mapping** area.
User Authentication	Supported	Configure user authentications in the **Security Settings** area.
Monitor Errors	Supported	Check the **Launch on System Event** and **Launch on User Event** check boxes.

Double-click **Troubleshooter** under **Configurations and Setup** to open the Troubleshooter setting tab page.



6 Replacement Examples: Functional Objects

This chapter describes examples of replacing functional objects such as ON/OFF buttons and bit lamps.

6-1 Functional Difference Between NS and NA: Common in Objects

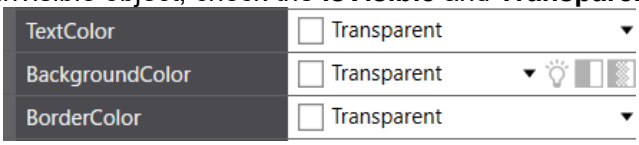
This section provides items common in components but have different features in the NS and NA series.

6-1-1 Behaviors of Overlapped Objects

In the NS series, objects without input function, e.g., shape, lamp, and label, do not prevent press inputs into objects behind. You can operate a button even when those objects are front of it. However, all objects do not allow you to operate objects behind them. For example, you cannot press a button if you have put another shape object in front of the button.
Therefore, do not place an object in front of a button.
Or remove a button behind and set the behavior of the button in **Events and Actions** - **Press** of the front object.

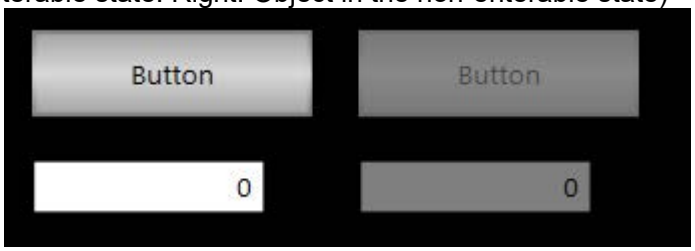
6-1-2 Behaviors of Hidden Objects

You can operate hidden objects, except Numeral Display and Input, and String Display and Input objects in the NS series.
In the NA series, if you uncheck the **IsVisible** check box to hide an object, you are not allowed to operate the object.
To create an operable invisible object, check the **IsVisible** and **Transparent** check boxes.



6-1-3 Appearance of Non-Enterable Object

The Na series objects will be forcibly grayed-out when they are in the non-enterable state.
(Left: Object in the enterable state. Right: Object in the non-enterable state)



To prohibit operations without changing the object's appearance, overlay another shape object on the object, not controlling inputs. Make the overlaid shape transparent. Then, show it while input is prohibited and hide while input is allowed.

6-1-4 Where to Use Macros in Object Settings

The table below shows where you can set subroutines in the NA series for replacing macros executed in the NS series object settings.

NS Functionality	NA Setting
Touch ON	Display **Events and Actions** of the object and select *Press* from the options in **Events**. Then, select *CallSubroutine* in **Actions**.
Touch OFF	Display **Events and Actions** of the object and select *Click* or *Release* from the options in **Events**. Then, select *CallSubroutine* in **Actions**.
Execute when ON	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name = True*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Execute when OFF	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name = False*] in **Expression**. Then, select *CallSubroutine* in **Actions**. Execute when OFF
Execute when ON/OFF	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name = True*] and [*Variable name = False*] in **Expression**, respectively. Then, select *CallSubroutine* in **Actions**. Execute when OFF
Before inputting numeral	No corresponding function
Before writing numeral	No corresponding function
When changing value	No corresponding function
When an address value changed	No corresponding function
Set Value = Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name = Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Set Value != Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name <> Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Set Value < Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name < Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Set Value <= Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name <= Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Set Value > Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name > Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.
Set Value >= Address Value	Display **Events and Actions** of the page and select *Condition* from the options in **Events** to enter [*Variable name >= Set value*] in **Expression**. Then, select *CallSubroutine* in **Actions**.

6-2 Non-replaceable Functionalities: Common in Objects

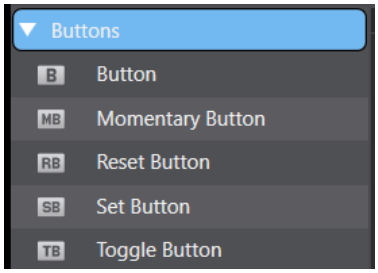
The following table shows the functionalities common in the NS series functional objects that cannot be replaced in the NA series.

NS Functionality	Remarks
Indirect reference of color/ Indirect reference of text color	The functions change the color of objects, such as ON/OFF buttons, bit lamps, and labels, and texts according to the value of an address. The NA series does not have corresponding functionalities and use the color code of the NS series.
Three-dimensional Frame	Simple frame only. Three-dimensional frame is not available.
Frame ON/OFF Display	This functionality is not supported because three-dimensional frame is not available.
Flicker	The NA series has the flicker functionality, but you cannot modify the flickering point and rate.
Turn ON the specified address when the value is confirmed	No corresponding function.
Display Write Confirmation Dialog	No corresponding function is available because the NA series does not have the dialog setting function.
Record to Operation Log - Message	The NA series cannot record messages for each object in the operation log.
Password	You can display a password input dialog box while pressing an object following the tangled procedure in “5-9 Password,” but the behavior differs from the NS series. Instead, we recommend using the NA security function and logging in with authorized username in advance.

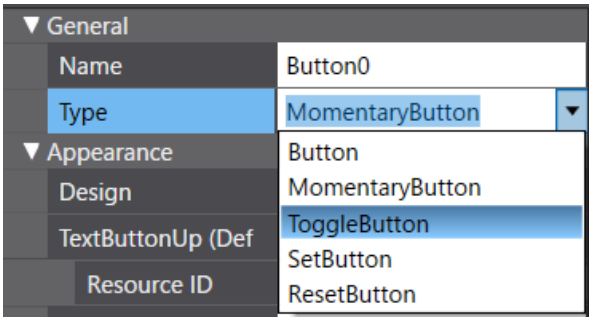
6-3 ON/OFF Button

In the NA series, button objects are classified into different objects: Button, Set Button, Toggle Button, Momentary Button, and Reset Button. Lay out an object for an action you want to create. Buttons are divided into different objects, but you can change the button type in **General** - **Type** in the Properties tab after placing the object.

Different objects in Toolbox



Change the button type in **General** - **Type** in the object’s Properties tab



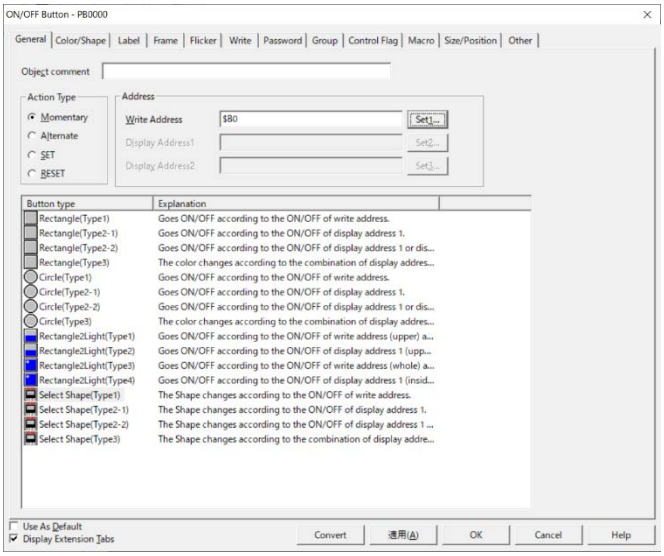
Precautions for Correct Use

There are some differences in the behavior of the momentary button between the NS and NA series. When communication with the controller is disconnected while you are pressing the momentary button, the NS unit checks the button state when communication is restored and writes the value to the allocation memory if there is a difference. Still, the NA unit does not write to the memory but only

reads the value of the allocated memory. Therefore, depending on the settings, the display may differ from the operation state, so please debug it when replacing it to ensure that unexpected behavior does not occur.

6-3-1 Button Types

The NS series ON/OFF button has various display statuses, e.g., write destination, display bit data, etc.



This section describes replacement procedure for each button type.
In the NA series, you can perform settings in **Behavior** - **VisualFeedback** in the **Properties** tab, which corresponds to Button type in the NS series. Some ON/PFF button types supported in the NS series have no functionalities in the NA series.

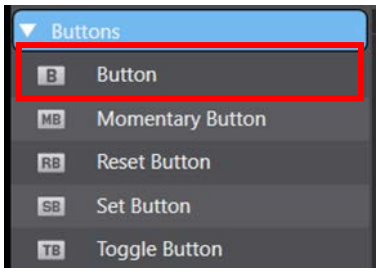
NS Action Type	NA Setting	Remarks
Rectangle/Circle/Select Shape (Type1)	Variable (Button)	
Rectangle/Circle/Select Shape (Type2-1)	Feedback (Button)	Enter an expression for changing the state in **FeedbackExpression**.
Rectangle/Circle/Select Shape (Type2-2)	Touch (Button) + Feedback (Button)	Enter an expression for changing the state in **FeedbackExpression**.
Rectangle/Circle/Select Shape (Type3)	No corresponding setting	This type does not have a functionality as a button itself, but you can create a similar display by overlaying buttons, lamps, and shapes.
Rectangle2Light(Type1)	Variable (Button) + Feedback (Indicator)	Select *Bottom* or *Custom* for **IndicatorPosition** to adjust the width, height, and position of the indicator.
Rectangle2Light(Type2)	No corresponding setting	
Rectangle2Light(Type4)	Variable (Button) + Feedback (Indicator)	I the NA series, the indicator corresponds to the ○ in an NS series object, but its shape is rectangle.
Rectangle2Light(Type4)	No corresponding setting	

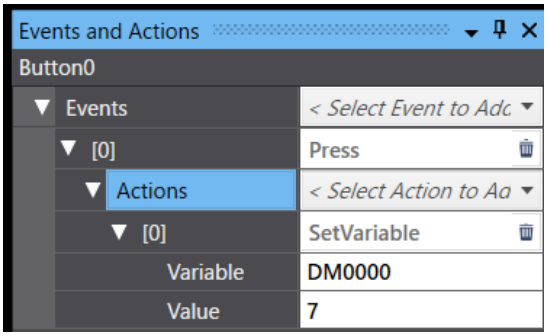
6-3-2 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
Label	Link with the Specified Address ON/OFF	In the NS series, you can change the status of objects and labels with different addresses, respectively, but in the NA series, the status of an object and that of a label is linked.
Group Specification	Group Specification	No corresponding function. You need create an action that when you press a button, it turns all the variables assigned to other buttons in the group OFF by using a subroutine.
Other	Do not allow sound for this object	No corresponding function.

6-4 Word Button

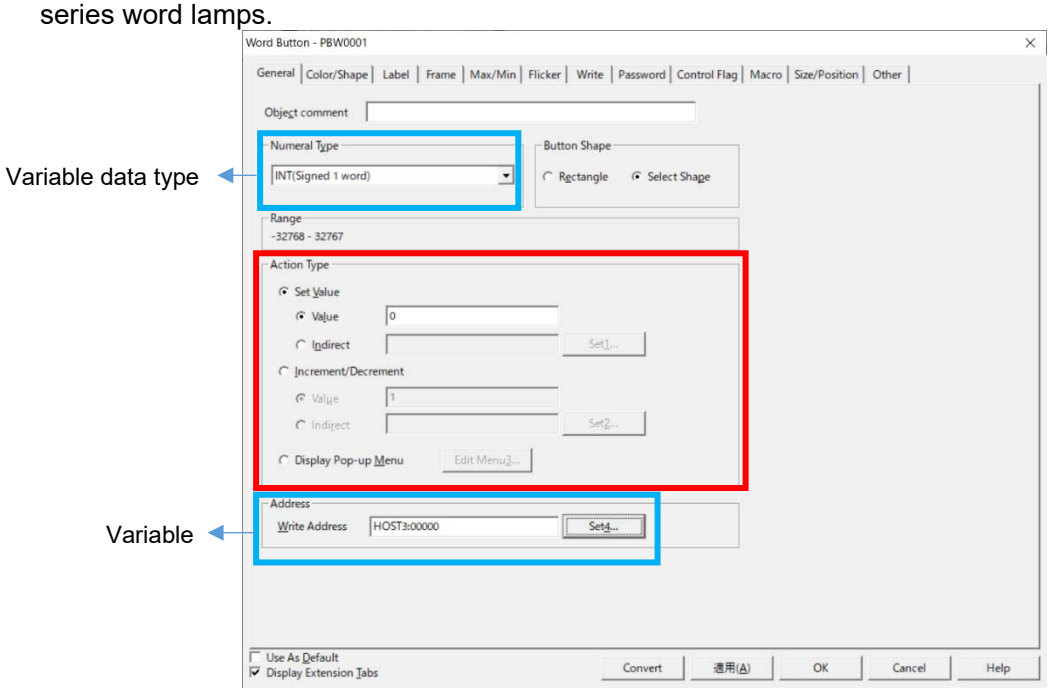
The NA series does not have a specific button with corresponding functionality. However, you can realize the functionality using a simple Button object in the following way: select *Press* from the **Events** options in **Events and Actions**. Then, select an appropriate action from the **Actions** options.





6-4-1 Button Actions

The table below provides alternate settings in the NA series for the button action settings of NS series word lamps.

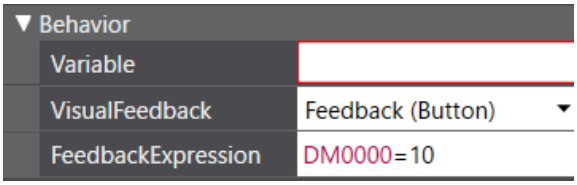


NS Action Type	NA Action	Remarks
Set Value - Value	SetVariable	Enter a value in the **Value** box.
Set Value - Indirect	SetVariable	Enter a variable name for indirect reference in the **Value** box.
Increment/Decrement - Value	IncreaseVariable DecreaseVariable	Enter a value to add or subtract in the **Value** box.
Increment/Decrement - Indirect	IncreaseVariable DecreaseVariable	Enter a variable name for indirect reference in the **Variable** box.
Display Pop-up Menu	No corresponding function	

● Set Value Match Color

You can select the set value match color when you choose **Set Value** in the Action Type area in the NS series. In the NA series, since buttons do not have a feedback expression, it is impossible to change a status using variables.

If you want to set the set value match color, prepare a momentary button and configure it to change when the value comes to the set value. For this example, the state changes when the value of the variable DM0000 comes to 10.



Leaving the Variable box blank will issue a warning at a build.
If you do not want the warning, create a dummy variable, and enter it in the Variable box.

6-4-2 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
Max/Min	Maximum Limit/ Minimum Limit	Configure the action so that a button works within the range of limits of inputs. You need a subroutine to replace these settings including the options, Return to the minimum/maximum value when the maximum/minimum value is exceeded.
Other	Do not allow sound for this object	No corresponding function.

6-5 Command Button

The NA series does not have a specific button with corresponding functionality. However, you can realize the following settings The selected standard Button object in the following way: select *Click* from the **Events** options in **Events and Actions**. Then, perform an appropriate setting in the **Actions** fields. Note that some functionalities cannot be replaced.

NS Functionality	NA Action	Remarks
Switch Screen - Specified Screen	ShowPage	Enter a destination page name in **PageName**.
Switch Screen - Indirect Specification of Screen No.	SetVariable	Enter the system-defined variable _HMI_CurrentPageIndex in the **Variable** box, and the indirect referencing variable name in the **Value** box, respectively.
Switch Screen - Selection by Pop-up Menu	No corresponding function	
Switch Screen - Backward	ShowPreviousPage	
Switch Screen - Forward	No corresponding function	
Switch Screen - Write Screen No. when Pressing the button	SetVariable	Enter the write destination variable name in the **Variable** box, and the system-defined variable _HMI_CurrentPageIndex in the **Value** box, respectively.
Key Button	No corresponding function	
Control Pop-up Screen - Close Local Pop-up Screen	ClosePage	Enter the name of the page you want to close in **PageName**.
Control Pop-up Screen - Close Specified Pop-up Screen	ClosePage	Enter the name of the page you want to close in **PageName**.
Control Pop-up Screen - Move Local Pop-up Screen	No corresponding function	
Display System Menu - System menu Top Page (Initialize Tab)	ShowSystemMenu	
Display System Menu - Switch Box Function	No corresponding function	
Display System Menu - Display Captured Data	No corresponding function	
Stop Buzzer	BuzzerOff	
None	No corresponding function	You can realize the same action by leaving **Events** settings empty. If another functionality, e.g., the Touch ON macro, is registered, configure a corresponding functionality.
Video Control - Video Capture	No corresponding function	
Video Control - Contrast Adjustment	No corresponding function	

NS Functionality	NA Action	Remarks
Video Control - Vision Sensor Console Output	No corresponding function	
Data Block Control - Read data from CSV file to PLC Data Block	No corresponding function	
Data Block Control - Write data from PLC Data Block to CSV file	No corresponding function	
Data Block Control - Read data from CSV file to NS PT Memory	No corresponding function	
Data Block Control - Write data from NS Data Block to CSV file	No corresponding function	
Data Block Control - Read data from NS PT Memory to PLC Data Block	No corresponding function	
Data Block Control - Write data from PLC Data Block to NS PT Memory	No corresponding function	
Data Block Control - Read record label	No corresponding function	
Data Block Control - Delete record	No corresponding function	
Authentication Cancellation	Logout	

6-5-1 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
Other	Do not allow sound for this object	No corresponding function.

6-6 Bit Lamp

The NS series bit lamps are replaceable with Bit Lamp Objects in the NA series.

NS Series	NA Series
General Tab 	Properties Label Tab 	

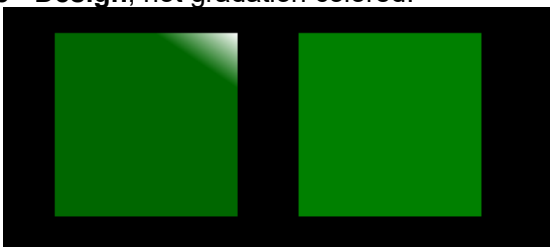
When you select Ellipse or Rectangle in **Appearance** - **Design** and choose a color, the upper-right part of the object will be forcibly colored gradationally, and the appearance will differ from an NS series bit lamp. If you want the same appearance, select *Image* in **Appearance** - **Design** to use an image file for the lamp's appearance. No gradation on the lamp. Note that you need to prepare an image file.

Left: Rectangle in **Appearance** - **Design**, forcibly gradation colored.
Right: Image in **Appearance** - **Design**, not gradation colored.



6-6-1 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
General	Double-line Circle	The NA series has only single-line frame.
General	Double-line Rectangle	The NA series has only single-line frame.
Macro	Macro Execution Condition	In the NA series, you cannot register an action to a lamp. Set a subroutine in **Events and Actions** of a page or global event.

6-7 Word Lamp

The NS series bit lamps are replaceable with Data Lamp Objects in the NA series.
Just like bit lamps, when you select Ellipse or Rectangle in **Appearance** - **Design** and choose a color, the upper-right part of the object will be forcibly colored gradationally.

6-7-1 Non-replaceable Functionalities

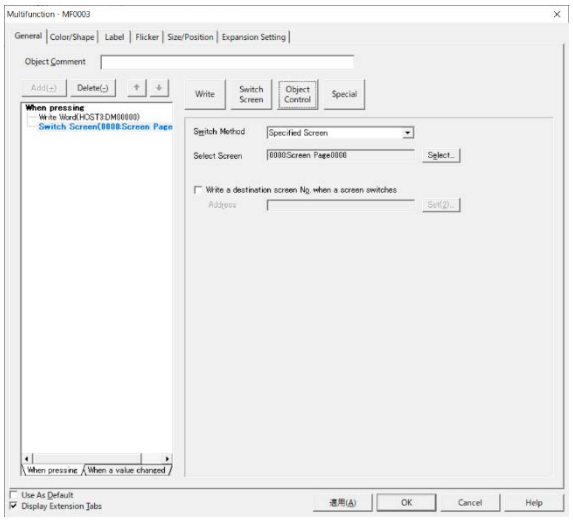
NS Tab	NS Functionality	Remarks
General	Double-line Circle	The NA series has only single-line frame.
General	Double-line Rectangle	The NA series has only single-line frame.
Label	Switch label according to the address value	It is impossible to read strings from a file. Enter a label directly in **Behavior** - **ColorRanges** in Properties.
Macro	Macro Execution Condition	In the NA series, you cannot register an action to a lamp. Set a subroutine in **Events and Actions** of a page or global event.

6-8 Multifunction

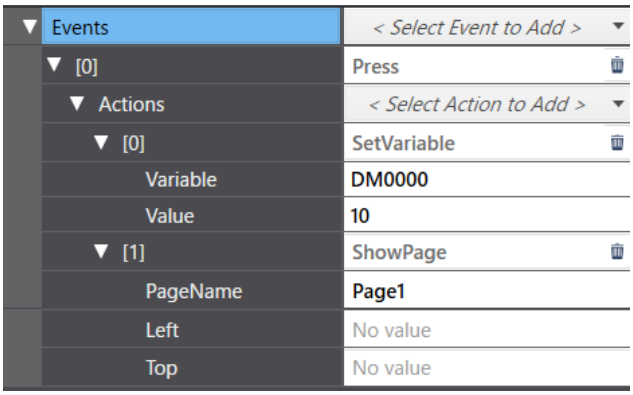
The NA series does not have a directly corresponding object, but you can achieve a similar functionality by registering multiple **Events and Actions** settings for a button object.

In the following example, a single object assigns a value to a variable and switches pages.

NS series



NA series



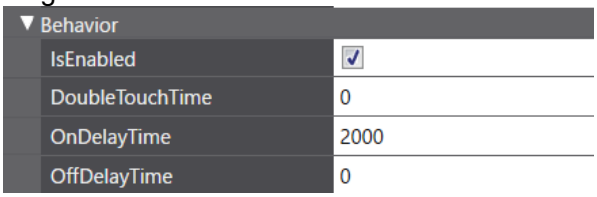
The table below provides relations between NS functionalities by a Multifunction object and NA actions.
Functionalities that can be replaced with a command button are omitted.

NS Functionality	NA Action	Remarks
Switch Screen - Next Page	No corresponding action	
Switch Screen - Previous Page	No corresponding action	
Object Control - Contents Control	No corresponding action	
Object Control - Alarm/Event Control - Clear	ClearUserAlarmLog	
Object Control - Alarm/Event Control - Save	SaveUserAlarmLogToFile	
Object Control - Alarm/Event Control - Home/End	CallSubroutine	Execute ScrollAlarmViewerList. The number of scrolling rows cannot be greater than the maximum of history records.
Object Control - Alarm/Event Control - Next/Previous	No corresponding action	
Object Control - Alarm/Event Control - From New Date & Time	CallSubroutine	Execute SortViewer.
Object Control - Alarm/Event Control - From Old Date & Time	CallSubroutine	Execute SortViewer.
Object Control - Alarm/Event Control - From High Priority	CallSubroutine	Execute SortViewer.
Object Control - Alarm/Event Control - From Low Priority	CallSubroutine	Execute SortViewer.
Object Control - Alarm/Event Control - From High Frequency	No corresponding action	The NA series alarm does not support frequency of occurrence.
Object Control - Alarm/Event Control - From Low Frequency	No corresponding action	The NA series alarm does not support frequency of occurrence.
Object Control - Alarm/Event Control - Check Selected Alarm	CallSubroutine	Execute AcknowledgeUserAlarm.
Object Control - Alarm/Event Control - Delete Selected Alarm	No corresponding action	The NA series alarm does not have a functionality to delete individual alarms.
Object Control - Alarm/Event Control - Check All Alarms	CallSubroutine	Execute AcknowledgeAllUserAlarms.
Object Control - Alarm/Event Control - Cancel All Alarms' Checks	No corresponding action	You cannot cancel the confirmed alarm.
Object Control - Alarm/Event Control - Change Display Type	CallSubroutine	Execute FilterByText. Configure the target column or text filtering, as needed.

NS Functionality	NA Action	Remarks
Object Control - Data Log Control - Start	StartDataLogging	
Object Control - Data Log Control - Stop	StopDataLogging	
Object Control - Data Log Control - Log Clear	No corresponding action	
Object Control - Data Log Control - Save to File	CallSubroutine	Execute ExportDataLogBuffer.
Object Control - Data Log Control - Read File	No corresponding action	
Object Control - Data Log Control - Pause	No corresponding action	
Object Control - Data Log Control - Move the cursor forward	CallSubroutine	Execute the function MoveTrendCursor.
Object Control - Data Log Control - Move the cursor backward	CallSubroutine	Execute the function MoveTrendCursor.
Object Control - Scroll Object	No corresponding function	
Special - Password Setting	No corresponding action	
Special - Confirmation Dialog Box	No corresponding action	
Special - Macro	CallSubroutine	Describe the processing, which is defined in Macro, in the subroutine.
Special - Initialize Operation Log	No corresponding action	
Special - Save Operation Log	CallSubroutine	Execute the function SaveOperationLogToFile.

6-8-1 Double Pressing and ON and OFF Delay Functions

In the NS series, Double Pressing and ON/OFF Delay functionalities are only supported by the Multifunction Object. These functionalities are available on Momentary Button, Toggle Button, Button, Set Button, and Reset Button in the NA series.
However, settable value range is narrower than the NS series.



NS Functionality	NS Setting Range	NA Setting Range
Double Pressing	0.5 to 30.0 s	0 to 2000 ms
On Delay	0.5 to 15.0 s	0 to 2000 ms
OFF Delay	0.5 to 15.0 s	0 to 2000 ms

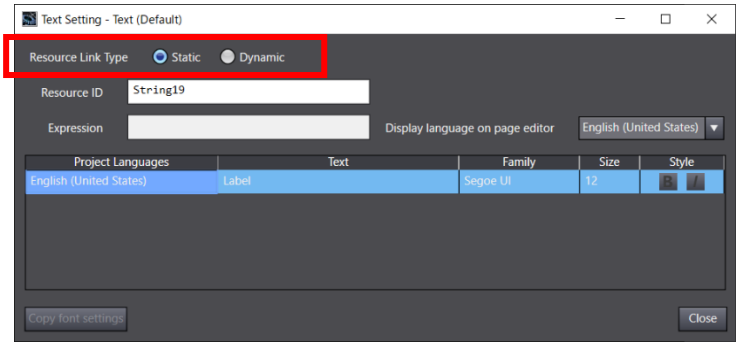
6-8-2 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
General	Prohibiting Simultaneous Pressing	Simultaneous pressing is not supported.
Color/Shape	Double-line Rectangle	The NA series has only single-line frame.
Color/Shape	Double-line Circle	The NA series has only single-line frame.
Color/Shape	Polygon	It is impossible to make a Button Object's appearance polygon. Instead, create a Polygon Object in **Shapes** - **Polygon**, then configure an action in **Events and Actions**.
Color/Shape	Sector	You cannot create a sector shape object.
Expansion Setting	Wait for completion of communication (Synchronous communication)	

6-9 Text

The NS series Text Objects are replaceable with Label Objects in the NA series.

To display a fixed character string on a label object, select *Static* for **Resource Link Type** in **Behavior** - **Text (Default)** in Properties of the object. Double-click a Label Object to display this setting dialog.

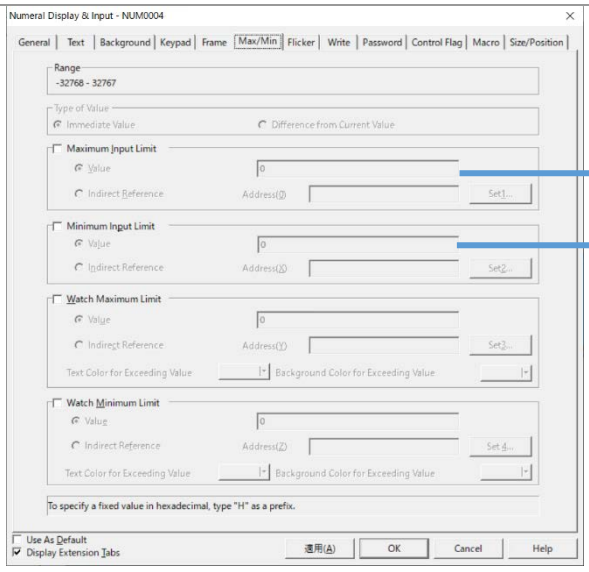


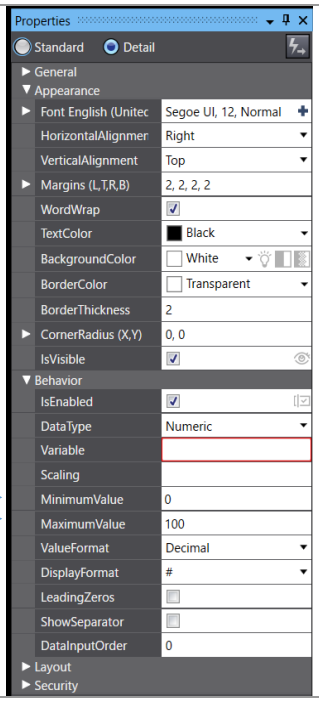
If you have selected the option, Use as a Message Display, or indirectly referenced a string for the NS text object, select *Dynamic* for **Resource Link Type** in **Behavior** - **Text (Default)** in Properties of the label object. Refer to 5-8-1 *How to Replace* for the setting procedure.

6-10 Numeral Display and Input

You can replace a String Display and Input Object with a Data Display Object or a Data Input Object. If you want only to display numerals, use a data display object, and also need to input, use a data input object.

Put an object on the page, then select *Numeric* and *Text* in **Behavior** - **DataType** in Properties.

NS series Numeral Display and Input General Tab	NA series Data Display Object Properties
	Max/Min Tab	**Data Input Object Properties**
	




6-10-1 Maximum and Minimum Limits and Unit Scaling for Numeral Input

The NA series employs the different method in setting the maximum and minimum numeral input values from the NS series.
For the NS series, scaled maximum and minimum limits will be the maximum and minimum limits for numeral inputs.
On the other hand, the NA series takes the set maximum and minimum limits as the maximum and minimum limits for numeral inputs.

The table below provides maximum and minimum input values for the NS and NA series.

Set Max. Limit	Unit Scaling	NS Max. Input Limit	NA Max. Input Limit
500	1	500	500
500	0.1	50.0	500
500	0.01	5.00	500

Set the maximum and minimum values for an NA unit with scaled NS values.

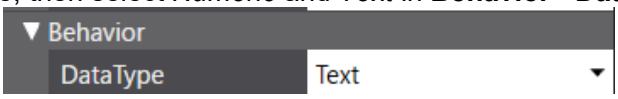
6-10-2 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
General	Display Type - Binary	
General	Display Type - Octal	
General	Storage Type - All BCD types	
General	Ignore exceeded digits	
General	Display input values by *	Only a character string can hide numerals and strings currently being entered.
Keypad	Input Method	The keypad is fixed to what you select in the Language Settings tab page. To display a desired keypad, set a subroutine in **Events and Actions** of the Data Display Object to run the subroutine EditVariable.
Keypad	Display Position of Keypad/Pop-up Screen	The keypad display position is automatically determined. You cannot display it at the desired position.
Max/Min	Type of Value - Difference from Current Value	
Max/Min	Watch Maximum Limit/ Watch Minimum Limit	You can change the colors in **Animations** - **ColorChange**. Note that only the numeral color in data display, and the background color in data input, are changeable. You are not allowed to change both colors of numerals and background.
Control Flag	Display/Hide (Numeral display)	
Macro	Before inputting numeral	
Macro	Before writing numeral	
Macro	When changing value	
Macro	Value = Set Value	Set a subroutine in **Events and Actions** of a page or global event.
Macro	Value > Set Value	
Macro	Value < Set Value	

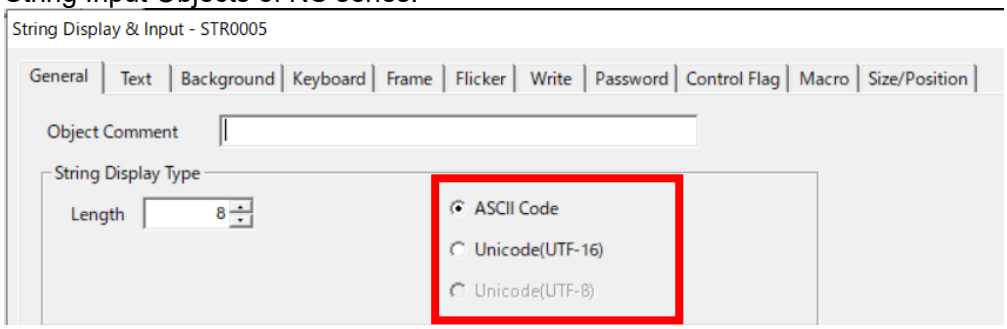
6-11 String Display and Input

You can replace a String Display and Input Object with a Data Display Object or a Data Input Object. If you have disabled inputs, use a Data Display Object, and if not, use a Data Input Object.

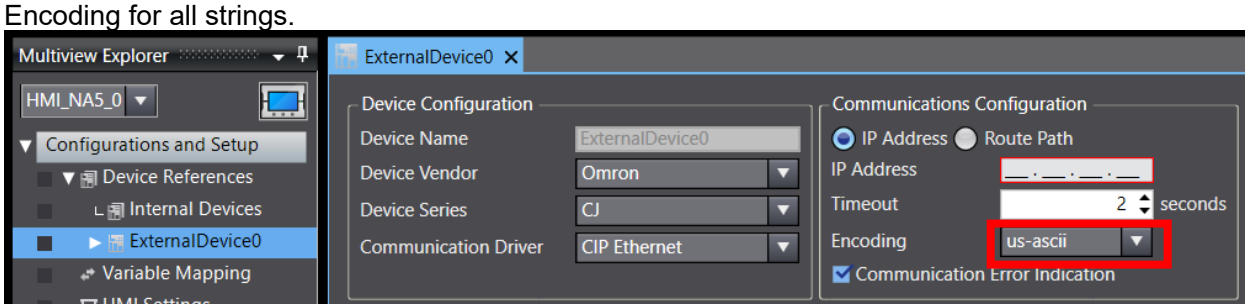
Put the object on the page, then select *Numeric* and *Text* in **Behavior** - **DataType** in Properties.



You can select a character code in the String Display Type area for a String Display Object and an String Input Objects of NS series.



You do not have to consider the character code if you use NS internal addresses to display strings. However, if you are using CJ host addresses, selecting an appropriate character encoding scheme in Sysmac Studio for the replacement is necessary.
The following shows the setting in Sysmac Studio. You can select a encoding scheme in the setting Encoding for all strings.

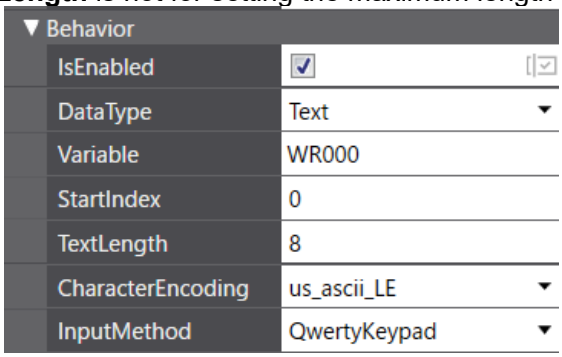


The table below provides the character code conversions.

NS		NA
System Language	String Display Type	Character Encoding Scheme
Japanese	ASCII code (Shift-JIS)	Shift-JIS
Chinese (Simplified and Traditional)	ASCII code (GB2312)	GB18030
English, Italian, Spanish, German, and French	ASCII code (Latin1)	ISO-8859-1
All Languages	Unicode (UTF-8)	UTF-8
All Languages	Unicode (UTF-16)	UTF-16

6-11-1 StartIndex and TextLength

StartIndex and **TextLength**, the data input object properties, are available only when specifying a numeric-type array for **Variable** and handling the array value as ASCII.
Entering values in **StartIndex** and **TextLength** will result in an error if you have set a string type variable in **Variable**. **TextLength** is not for setting the maximum length of input.

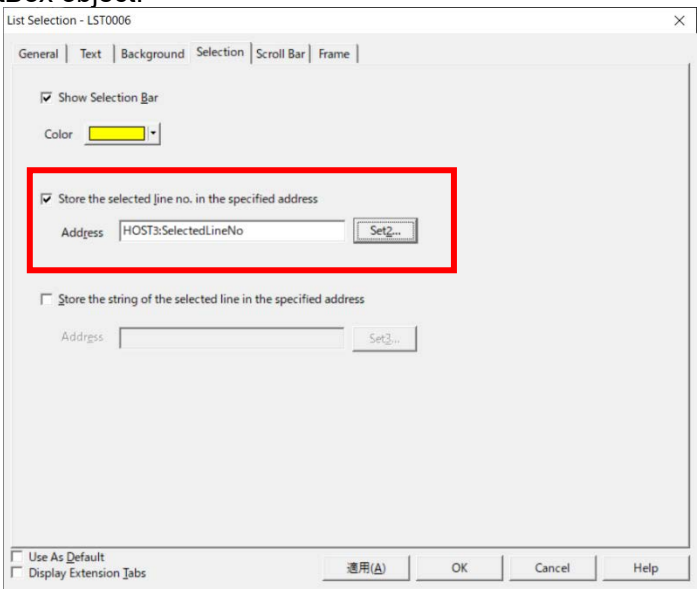


6-11-2 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
General	String Display Type	The text length cannot be configured while a string type variable is used.
General	Pop-up Menu	
General	Address Information	It is not allowed to set different variables to reference for each language.
General	Input Process	
Keyboard	Input Method	The keypad is fixed to what you select in the Language Settings tab page. To display a desired keypad, set a subroutine in **Events and Actions** of the Data Display Object to run the subroutine EditVariable.
Keyboard	Display Position of Keypad/Pop-up Screen	The desired position of a keypad is determined automatically. You cannot display it at the desired position.
Keyboard	String Input	Fixed to **Add to the current string**.
Macro	Before inputting string	
Macro	Before writing string	
Macro	When changing string	

6-12 List Selection

Only an action that the option **Store the selected line No. in the specified address** is enabled can be replaced with a ListBox object.



6-12-1 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
General	List Data	The NA series cannot have the list data in an internal variable or a file. The data is stored statically in **Behavior** - **Items** in Properties of the ListBox object. Edit fixed strings, which are managed by resource ID, in **Resources** - **General Strings**. You are not allowed to switch a displayed string dynamically during the operation because strings in the ListBox object are fixed.
General	Character Code	
General	List Size	
Selection	Show selection bar	The selection bar is always displayed. The bar color is not changeable.
Selection	Store the selected line No. in specified address	A selection in the ListBox Object is to be output to a numeral only.
Scroll Bar		The scroll bar is mandatory. The scroll bar is displayed automatically on the object with too many options considering its size.
External Control	Block	
External Control	Start Line	
External Control	Update	

6-13 Analogue Meter

The NS Analogue Meter Object can be replaced with an NA Gauge Object: Full Gauge or Half Gauge.
Only **Needle** is available for indication.

6-13-1 Non-replaceable Functionalities

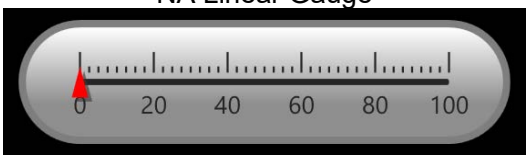
NS Tab	NS Functionality	Remarks
General	Width Rate	
General	Shape - Quarter circle	Configure **StartAngle** and **EndAngle** in **Properties** - **Appearance** of the object to realize a similar appearance.
General	Color inside a meter	
General	Display Type	The option *Fill* is not supported.
Range	Indirect	Only fixed values are supported.

6-14 Level Meter

The NS Level Meter Object can be replaced with an NA Gauge Object: Vertical Gauge or Horizontal Gauge.
However, the appearances differ significantly: the NS level meter looks like a bar chart, and in the NA linear gauge, the marker moves to indicate a value as illustrated below.

NS Level Meter

NA Linear Gauge



6-14-1 Non-replaceable Functionalities

NS Tab	NS Functionality	Remarks
Range	Indirect	Only fixed values are supported.

6-14-2 Realizing the Same Appearance as NS Object

To get the same bar chart appearance as the NS level meter object, use a Rectangle Object from **Shapes**, not a Vertical/Horizontal Linear Gauge Object. Specify a variable in **Animations** - **ResizeWidth** for a graph whose indicator increases/decreases in the horizontal direction, and **Animations** - **ResizeHeight** if the indicator moves vertically, to adjust the size of the rectangle. Another object is required to create the scale. In addition, if you want different colors for levels, multiple rectangle objects are necessary.

6-15 Broken-line Graph

The NS Broken-line Graph Object can be replaced with the NA Broken-line Graph Object.

Functionalities not supported by the NA broken-line graph object, e.g., zooming in/out the graph, moving the cursor, can be realized with subroutines.

We offer the IAG Library for the NA series, which include basic function features.
You can get an NA IAG library from the OMRON website. Visit the following link. https://assets.omron.com/m/5bf56e1c1780d236/original/IAG-Software.zip

6-15-1 Non-replaceable Functionalities

This table shows the functionality not supported by the object settings.

NS Tab	NS Functionality	Remarks
General	Direction	Fixed to the setting corresponding to the NS setting Right.
General	Line Style	Only the solid line is supported in both of the vertical and horizontal directions.
General	Indirect reference of showing scale line	Not available in both of the vertical and horizontal directions.
General	Specify the No. of points shown	
Graph	Draw Value Outside of the Range	If a value exceeds the upper or lower limit, it will be displayed as the maximum or minimum value.
Scroll Bar		A scroll bar is not displayed.
-	Test Function	Broken-line graphs are displayed as fixed images on the simulator. To test a graph display, transfer the project to the NA unit.

The NA series has the following restrictions on the number of graphs you can put on a page:
1) One graph object, including a trend graph object, per page
2) Up to eight graph objects, including a trend graph object, per HMI project
The limits are total of broken-line graph objects and trend graph objects.

6-16 Bitmap

The NS series Bitmaps are replaceable with Image Objects in the NA series.

6-16-1 Non-replaceable Functionalities

This table shows the functionality not supported by the object settings.

NS Tab	NS Functionality	Remarks
General	Indirect Reference of Display File	

6-17 Alarm/Event Display

The NA series does not have an alternate functionality, but you can realize it following the method below.

1. Define a String type global variable, NS_alarmMessage.
2. Name the alarm as [fixed string + serial number] in the user alarm setting. For this example, the fixed string is “Group0_alm.”
3. Create a subroutine NS_getAlarmMessage as a global subroutine.

```
Sub NS_getAlarmMessage
    Dim almID As String
    Dim almMsg As String
    Dim almDt As Date
    Dim almMsg_Newest As String
    Dim almDt_Newest As Date
    Dim i As Integer
```

```
    'Repeats as many times as set alarms. In this example, 22 alarms are set.
    For i = 0 To 21
      almID = "Group0_alm" + i.ToString
      If IsUserAlarmActive(almID)
        GetAlarmInfo( almID, , , , , almMsg, , almDt, , )
       If DateTime.Compare( almDt, almDt_Newest ) > 0
        almDt_Newest = almDt
        almMsg_Newest = almMsg
       End If
      End If
    Next

   If almMsg_Newest <> ""
    NS_alarmMessage = almMsg_Newest + " " + almDt_Newest
    Else
    NS_alarmMessage = ""
    End If
End Sub
```

When assigning a string to the variable NS_alarmMessage, you can change display contents by adding various alarm setting information that GetAlarmInfo() acquired.

4. Select *Interval* for **Events** and *CallSubroutine* for **Actions** of the global event to call NS_getAlarmMessage.
5. Put a data display object on a page where you display an alarm object. Then, select *String* for **Data Type** in **Behavior** in Properties and *NS_alarmMessage* for **Expression**.

Follow this procedure to realize the flowing string.

1. Add the integer type global variable, before_Second.
2. Add the subroutine nagare() in Actions - CallSubroutine of the page.

The data display object's **Name** attribute is DataDisplay0.
The value used in the IF statement depends on the width of the data display object and the screen size.

```
Sub nagare()
  DataDisplay0.Left = DataDisplay0.Left – 16
  If DataDisplay0.Left < -200 Then DataDisplay0.Left = 800
  before_Second = _HMI_Second
End Sub
```

3. Select *Condition* from the **Events** options in **Events and Actions** of the page. Then, enter *_HMI_Second*<> in **Expression**. And select *CallSubroutine* from the options of **Actions** and specify *nagare()* in **SubroutineName**.
4. Arrange the data display object as much as behind because a flowing string will be displayed without relation to other objects on the right and left sides of the display area. Then, put a rectangle object, which cover the string, in front of the data display object.

The Data Display Object moves to the left by 16 dots per second.
However, the display position moves sideways regardless of the coordinates of the data display object on Sysmac Studio. Therefore, you need to modify values for VB functions to adjust the display position.

For another method, edit the string to be displayed as flowing string, not hanging the position of the data display object.
Execution condition for a subroutine is the same as mentioned above, but describe the subroutine as the following.
Enter *strAlarmMove* into **Expression**, the Data Display Object's property.

```
Dim pos As Integer

Sub nagare
   Dim px As Integer = NS_alarmMessage.Length

   If (px > 0)
      Dim strMove As String = NS_alarmMessage + "              "
      px = px + 8

      pos = pos - 1
      If (pos > px) Or (pos < 1)
         pos = px
      End If

      strAlarmMove = Microsoft.VisualBasic.Right(strMove, pos) _
                     + "              " _
                     + Microsoft.VisualBasic.Left(strMove, px - pos)
   Else
      strAlarmMove = ""
   End If

   before_Second_13 = _HMI_Second
End Sub
```

6-18 Alarm/Event Summary and History

You can replace an Alarm/Event Summary and History Object with a User Alarms Viewer Object.

6-18-1 Non-replaceable Functionalities

This table shows the functionality not supported by the object settings.

NS Tab	NS Functionality	Remarks
General	Group Specification	
General	Display Type	
General	Default Display Order (Frequency)	The NA series does not have a functionality to record the frequency.
General	Date and Time Display Format	The date and time display format is fixed.
General	Display in the Same Line	The NA series always displays alarm occurrence and clearance in the same row.
General	Movement when Alarm/Event is Selected	
Display	Line Height	Automatically tuned depending to text size.
Display	Display Optimization	
Display	Display a title	Header cannot be hidden. Setting the lowest value, 1, for the height makes the header as if it were hidden.
Display	Message box display	
Display	Ruled Line	
Display	History Display Type	You cannot display occurrence and cancellation in the same row.
Icon		Subroutines can substitute some functions. Assign a corresponding functionality to a button or other object.
Vertical Scroll Bar	Use Scroll Bar	The scroll bar is displayed automatically on the object when the display contents exceed the object size. It cannot be hidden.
Horizontal Scroll Bar	Use Scroll Bar	The scroll bar is displayed automatically on the object when the display contents exceed the object size. It cannot be hidden.
Macro		Pressing an icon does not start an action including macro.

6-18-2 Replacing Icons

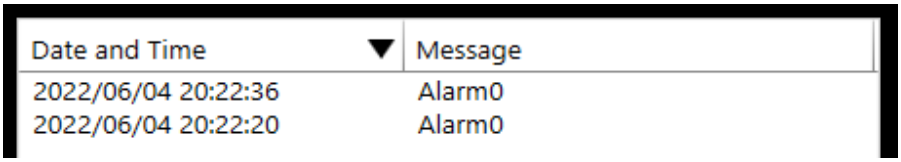
In the NS series, you can sort and delete displayed alarms with icons.
The NA series alarm objects do not have these icons, but you can realize someicons functionalities with subroutines.

Functionality of Icon	Alternate Subroutine	Remarks
From New Date & Time	SortViewer	If sorting targets are not in the columns, an error occurs when you run a subroutine. It is possible to sort alarms by touching the header. Every time you touch the header, sorting order, ascending or descending, switches.
From Old Date & Time	SortViewer	
From High Priority	SortViewer	
From Low Priority	SortViewer	

Functionality of Icon	Alternate Subroutine	Remarks
From High Frequency	-	
From Low Frequency	-	
Delete Selected Alarm	-	
Check Selected Alarm	AcknowledgeUserAlarm	
Check All Alarms	AcknowledgeAllUserAlarms	
Cancel All Alarms' Check	-	
Change Display Type	-	

6-18-3 Setting for Distinguishing Occurrence and Cancellation of Alarms

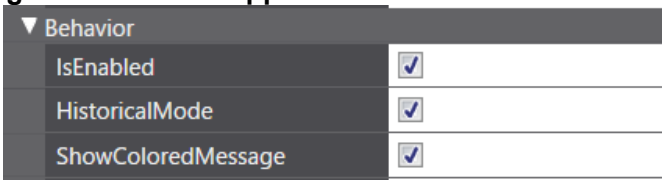
User alarm viewer objects of the NA series cannot display an alarm occurrence and cancellation in the same row. Depending on the setting, you cannot differentiate them.



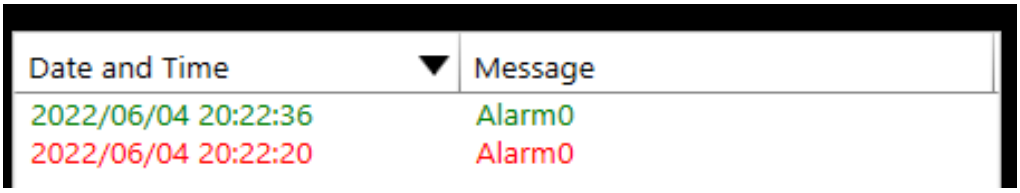
The following method enables you to distinguish the information.

- Coloring Messages

Check the **ShowColoredMessage** box in **Behavior**. The color of an alarm string will change according to the color set in the **RaisedUnacknowledgedColor** or **RaisedAcknowledgedColor** field in **Appearance**.

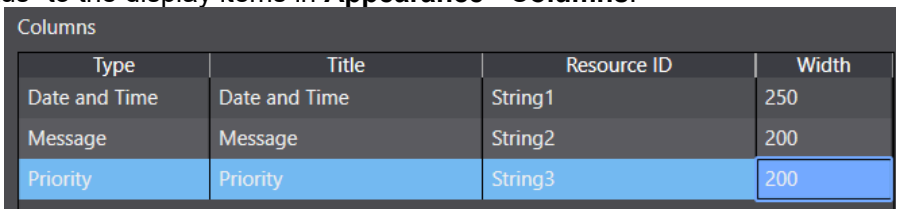


The following illustrates an alarm occurrence message shown in red and cancellation in green.

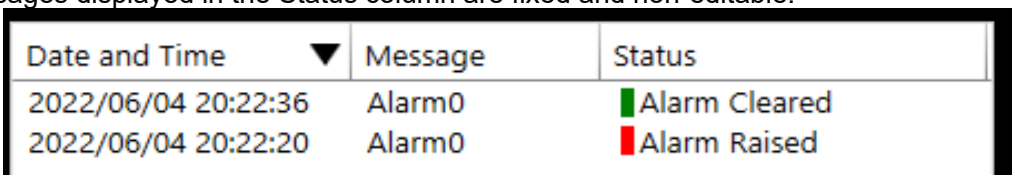


- Adding Status to Display Items

Add “Status” to the display items in **Appearance** - **Columns**.



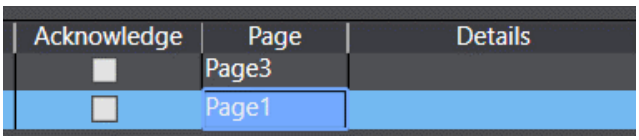
An occurrence and a cancellation will be displayed as “Alarm Raised” and “Alarm Cleared” in the Status column.
Messages displayed in the Status column are fixed and non-editable.



6-18-4 Alternative for Page Transition When Selecting an Alarm

This section describes an alternative for the functionality to go to a page after selecting a displayed alarm.
In the NS series, selecting an alarm switches the currently displayed page to the page you set. However, in the NA series, additional action is required after selecting an alarm for page transition.

1. Enter destination page names in the **Page** field for each alarm in the User Alarm Group setting tab page.



2. Create an object. Then select *Click* from **Events** and *ShowAlarmPage* from **Actions** in **Events and Actions**.
   Enter the page name where the user alarm viewer object is in **PageName** and the name of the user alarm viewer object in **AlarmViewerName**.

   This setting enables you to go to the set page when you press the object while selecting the alarm on the user alarm object.

6-19 Date and Time

The NS series Date Object and Time Object are replaceable with a DateTime Object in the NA series.

In the NS series, the date and time are displayed separately with a date object and time object, respectively. In the NA series, the date and time is displayed with a single object. By changing the display format, you can display either date or time alone.

In the NS series, you press an object to edit the date and time settings to change the system clock. However, in the NA series, a DateTime object only displays data and does not change the system clock setting.

Change the system clock setting from the system menu or use a subroutine.
To use the subroutine, you must combine button objects and data input objects to input date and time data.

6-20 Data Log Graph

The NS series Data Log Graph is replaceable with Trend Graph Object in the NA series.
Trend graph objects do not support zooming in/out of a graph and moving the cursor. You can use subroutines to substitute these functionalities. We offer the IAG Library for the NA series, which include subroutines used in combination with a trend graph object.. You can get an NA IAG library from the OMRON website. Visit the following link.
https://assets.omron.com/m/5bf56e1c1780d236/original/IAG-Software.zip

6-20-1 Non-replaceable Functionalities

This table shows the functionality not supported by the object settings.

NS Tab	NS Functionality	Remarks
General	Direction	Fixed to the setting corresponding to the NS setting Right.
General	Draw Value Outside of the Range	If a value exceeds the upper or lower limit, it will be displayed as the maximum or minimum value.
General	Line Style	Only the solid line is supported in both of the vertical and horizontal directions.
Time Axis	Scale	Indirect reference is not supported.
Time Axis	Use Cursor	Use of cursor is selectable, but the feature to store values of the color or cursor position is not available.
Time Axis	Graph Display Position	
Numeral Value Axis	Scale Settings	Only the functionality of setting the maximum and minimum values as fixed values is supported.
Icon		Subroutines can substitute some functions. Assign a corresponding functionality to a button or other object.
Scroll Bar		A scroll bar is not displayed.
-	Test Function	Trend graphs are displayed as fixed images on the simulator. To test a graph display, transfer the project to the NA unit.

The NA series has the following restrictions on the number of graphs you can put on a page:
1) One graph object, including a broken-line graph and trend graph, per page
2) Up to eight graph objects, including a broken-line graph and trend graph, per HMI project

6-20-2 Replacing Icons

For the NS series data log graphs, you can use icons to stop or restart drawing a graph, but the NA series trend graph objects do not have those icons. You can substitute subroutines for some functionalities.

Functionality of Icon	Alternate Subroutine	Remarks
Stop	StopDataLogging	**StopDataLogging** in **Events and Actions** works in the same way.
Restart	StartDataLogging	**StartDataLogging** in **Events and Actions** works in the same way.
Status	-	Difficult to replace
Log Clear	-	Executing ClearDataLogBuffer alone does not delete all the data. You must delete log files stored in the external memory.
Pause	-	Difficult to replace
Save to File	ExportDataLogBuffer(DataSetName)	
Read File	-	Difficult to replace

6-21 Data Block Table

Recipe Viewer is corresponding to Data Block Table in the NA series, though the feature is largely different.
In the NA series, you use subroutines to read or write the data.
We offer the IAG Library for the NA series, which include basic function features. You can get an NA IAG library from the OMRON website. Visit the following link.
https://assets.omron.com/m/5bf56e1c1780d236/original/IAG-Software.zip

6-21-1 Non-replaceable Functionalities

This table shows the functionality not supported by the object settings.

NS Tab	NS Functionality	Remarks
General	Display No. of rows	
Background	Color of Odd Rows	You cannot set different colors for each row.
Background	Color of Even Rows	You cannot set different colors for each row.
Vertical Scroll Bar		A scroll bar is not displayed.
Horizontal Scroll Bar		A scroll bar is not displayed.
Macro		Pressing an icon does not start an action including macro.

6-21-2 Replacing Icons

NS Data Blocks allow you to read or write data with icons, but in NA recipes, you cannot use those icons. You can substitute subroutines for some functionalities.

Functionality of Icon	Alternate Subroutine	Remarks
Read Data File	ImportRecipes	
Write Data File	-	Use “Export_recipe” in the AN series IAG Library.
Write to the address	WriteRecipeToController	
Read from the address	ReadRecipeFromController	
Add the record	AddRecipe	
Delete the record	DeleteRecipe	

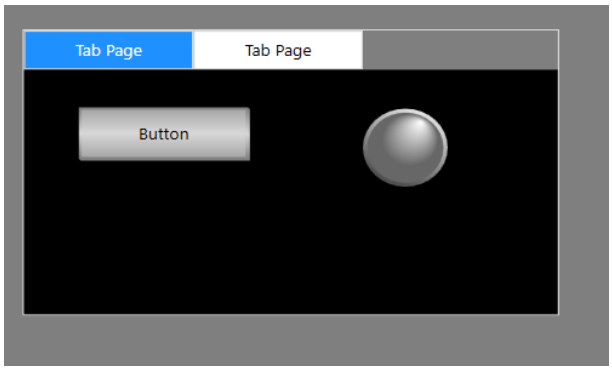
6-22 Frame

Replaceable with Tab Control Object.

6-22-1 Functional Differences

The table below shows functional differences you should consider.

Functionality	Difference
Tab page arrangement	NS series: Four edges of the screen NA series: Top and bottom of the screen You cannot place a tab page on the right and left sides.
Origins of coordinates of an object inside the frame	NS series: Coordinates of the upper-left corner of the frame NA series: Coordinates of the uppe-left corner of the page
Object frame	Both of the NS series and NA series do not have the setting field for object frame. However, frames are forcibly given on the NA series objects. (See the illustration below)

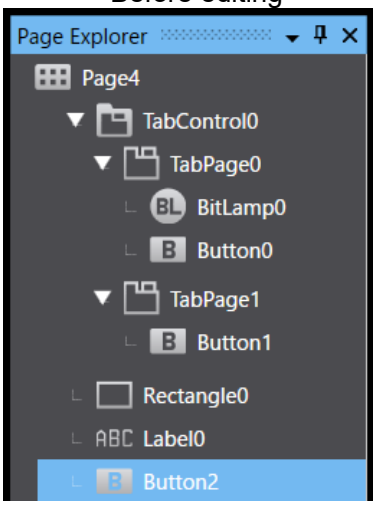


6-22-2 Workaround When You Cannot Arrange an Object on Tab Control Object

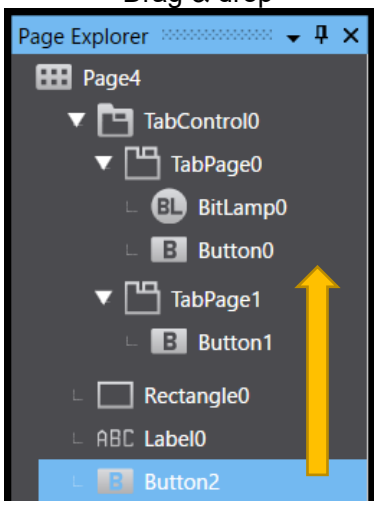
When you attempt to arrange an object on a tab control object on the Edit Pane, sometimes you may fail, and the object is placed on the base screen. In that case, try to manipulate the objects on Page Explorer, where you can edit easier.

See the screen shots below. To put the object Button2 on the tab control object, select *Button2* in Page Explorer then drag and drop on a desired tab page in the tab control object.

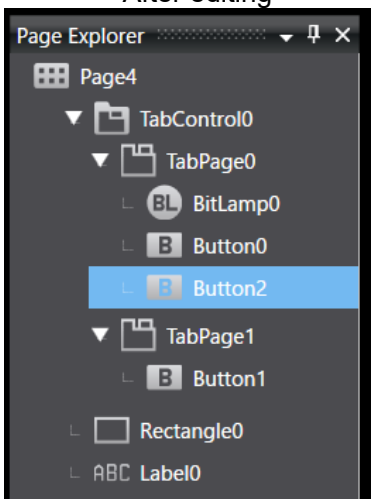
Before editing



Drag & drop



After editing



6-23 Table

No functionality for direct replacement.

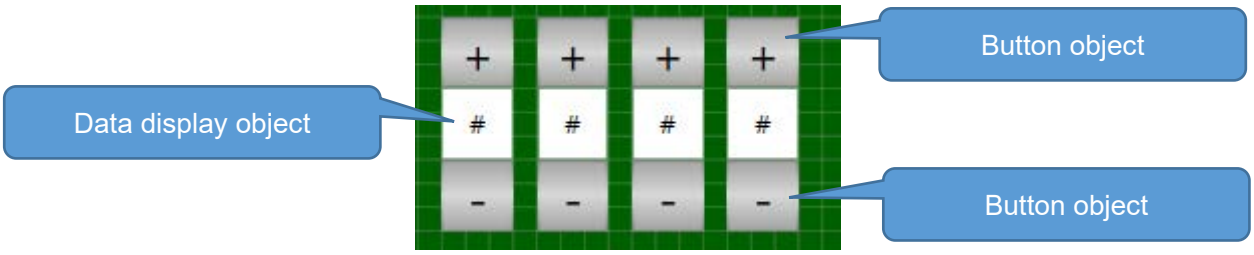
Replace a table with Button, Lamp, Data Display, or Data Input Object according to the type of functional object in the pull-down menu **Table Type**. To copy an object and paste it tiled in the vertical or horizontal direction, select the object and right-click to choose **Create Duplicate Objects...** from the menu.

6-24 Thumbwheel Switch

There is no features for replacement.
However, combination of data display objects, objects such as buttons, and subroutines can achieve a thumbwheel switch. This section provides the replacement procedure. Details of the procedure depends on digits and numerical notation system. In this example, replace unsigned 4-digit decimal and hexadecimal thumbwheel switches.

6-24-1 Replace Thumbwheel Switch: Arrange Objects

In the page editor, arrange button objects and data display objects to represent a thumbwheel switch.



6-24-2 Replace Thumbwheel Switch: Register a Global Variable

Register a variable used for a thumbwheel switch as a global variable.
Basically, prepare one variable for one thumbwheel switch.
In this example, use the variable TW14_Dec for a decimal thumbwheel switch and the variable TW15_Hex for a hexadecimal thumbwheel switch, respectively.

Variable Name	Data Type	Initial Value	AT	Retain	Constant	Update Rate	Scaling	Comment
TW14_Dec	Integer			False	False	0	N/A	
TW15_Hex	UInteger			False	False	0	N/A	

6-24-3 Replace Thumbwheel Switch: Edit a Global Subroutine

Create a subroutine that commonalizes the operations of the + and - buttons in each digits of the thumbwheel switch as a global subroutine.
The name of the global subroutine is *SamRotarySwitch*.

The functions CountUpDec and CountUpHex are for the action triggered by pressing the + button for each digit. Specify the first argument with a variable that changes a value, the second argument with an additional value, and the third argument with a maximum value, respectively.

The functions CountUpDec and CountUpHex are for the action triggered by pressing the - button for each digit. Specify the first argument with a variable that changes a value, the second argument with an additional value, the third argument with a maximum value, and the fourth argument with a minimum value, respectively.

For unsigned decimal thumbwheel switch

```
'Pressing the + button
Sub CountUpDec(ByRef val As Integer, addValue As Integer, maxValue As Integer)
    If maxValue < (val + addValue) Then Exit Sub

    'Reset the value of the digit to zero if the value becomes 9 by addition.
    Dim buf = val ¥ addValue Mod 10
    If buf = 9 Then
        val -= buf * addValue
        Exit Sub
    End If

    val += addValue
End Sub

'Pressing the - button
Sub CountDownDec(ByRef val As Integer, subValue As Integer, maxValue As Integer, minValue As Integer)
    'Reset the value of the digit to 9 if the value becomes zero by subtraction.
    Dim buf = val ¥ subValue Mod 10
    If buf = 0 Then
        Dim buf2 = val + (9 * subValue)
        If maxValue < buf2 Then
            Exit Sub
        Else
            val = buf2
            Exit Sub
        End If
    End If

    If (val - subValue) < minValue Then Exit Sub

    val -= subValue
End Sub
```

For unsigned hexadecimal thumbwheel switch

```
'Pressing the + button
Sub CountUpHex(ByRef val As UInteger, addValue As UInteger, maxValue As UInteger)
    If maxValue < (val + addValue) Then Exit Sub

    'Reset the value of the digit to zero if the value becomes F by addition.
    Dim buf = val ¥ addValue Mod &H10
    If buf = &HF Then
        val -= buf * addValue
        Exit Sub
    End If

    val += addValue
End Sub

'Pressing the - button
Sub CountDownHex(ByRef val As UInteger, subValue As UInteger, maxValue As UInteger, minValue As
UInteger)
    'Reset the value of the digit to F if the value becomes zero by subtraction.
    Dim buf = val ¥ subValue Mod &H10
    If buf = 0 Then
        Dim buf2 = val + (&HF * subValue)
        If maxValue < buf2 Then
            Exit Sub
        Else
            val = buf2
            Exit Sub
        End If
    End If

    If (val - subValue) < minValue Then Exit Sub

    val -= subValue
End Sub
```

6-24-4 Replace Thumbwheel Switch: Define a Page Subroutine

For a button object, you cannot specify an argument in a function that specifies CallSubroutine for an action of the Click event. In other words, you are not allowed to specify a function with an argument that is defined in a global subroutine. Therefore, define the page subroutine in the code view of the page as shown below.

The functions Wheel_u1 and the followings are for the processes after pressing the + and - buttons. In this example, the letter “u” stands for “up (+)” and “d” for “down (-)”, and numbers from 1 to 1000 stands for the ones place to the thousands place, respectively.

For unsigned decimal thumbwheel switch

```
Sub Wheel_u1_Dec()
   SamRotarySwitch.CountUpDec(TW14_Dec, 1, 9876)
End Sub

Sub Wheel_u10_Dec()
   SamRotarySwitch.CountUpDec(TW14_Dec, 10, 9876)
End Sub

Sub Wheel_u100_Dec()
   SamRotarySwitch.CountUpDec(TW14_Dec, 100, 9876)
End Sub

Sub Wheel_u1000_Dec()
   SamRotarySwitch.CountUpDec(TW14_Dec, 1000, 9876)
End Sub

Sub Wheel_d1_Dec()
   SamRotarySwitch.CountDownDec(TW14_Dec, 1, 9876, 0)
End Sub

Sub Wheel_d10_Dec()
   SamRotarySwitch.CountDownDec(TW14_Dec, 10, 9876, 0)
End Sub

Sub Wheel_d100_Dec()
   SamRotarySwitch.CountDownDec(TW14_Dec, 100, 9876, 0)
End Sub

Sub Wheel_d1000_Dec()
   SamRotarySwitch.CountDownDec(TW14_Dec, 1000, 9876, 0)
End Sub
```

For unsigned hexadecimal thumbwheel switch

```
Sub Wheel_u1_Hex()
   SamRotarySwitch.CountUpHex(TW15_Hex, &H1, &H4321)
End Sub
```

```
Sub Wheel_u10_Hex()
   SamRotarySwitch.CountUpHex(TW15_Hex, &H10, &H4321)
End Sub

Sub Wheel_u100_Hex()
   SamRotarySwitch.CountUpHex(TW15_Hex, &H100, &H4321)
End Sub

Sub Wheel_u1000_Hex()
   SamRotarySwitch.CountUpHex(TW15_Hex, &H1000, &H4321)
End Sub

Sub Wheel_d1_Hex()
   SamRotarySwitch.CountDownHex(TW15_Hex, &H1, &H4321, 0)
End Sub

Sub Wheel_d10_Hex()
   SamRotarySwitch.CountDownHex(TW15_Hex, &H10, &H4321, 0)
End Sub

Sub Wheel_d100_Hex()
   SamRotarySwitch.CountDownHex(TW15_Hex, &H100, &H4321, 0)
End Sub

Sub Wheel_d1000_Hex()
   SamRotarySwitch.CountDownHex(TW15_Hex, &H1000, &H4321, 0)
End Sub
```

6-24-5 Replace Thumbwheel Switch: Configure a Button Event

In the page editor, select Click from [Events] for the + and - buttons. Then, select CallSubroutine from [Actions] to enter the page subroutines from Wheel_u1 to Wheel_u1000, and Wheel_d1 to Wheel_d1000 in SubroutineName, respectively.

6-24-6 Replace Thumbwheel Switch: Configure Data Display Objects

In the page editor, enter the following conditional expressions in Expression for the numeric-type data display objects of each digit. The expressions calculate the value of the specified digit.

Conditional expressions for an unsigned decimal thumbwheel switch

Format	Displayed Digit	Conditional Expression
Decimal	Ones place	TW14_Dec ¥ 1 Mod 10
Decimal	Tens place	TW14_Dec ¥ 10 Mod 10
Decimal	Hundreds place	TW14_Dec ¥ 100 Mod 10
Decimal	Thousands place	TW14_Dec ¥ 1000 Mod 10

Conditional expressions for an unsigned hexadecimal thumbwheel switch

Format	Displayed Digit	Conditional Expression
Hexadecimal	Ones place	TW15_Hex ¥ &H1 Mod &H10
Hexadecimal	Tens place	TW15_Hex ¥ &H10 Mod &H10
Hexadecimal	Hundreds place	TW15_Hex ¥ &H100 Mod &H10
Hexadecimal	Thousands place	TW15_Hex ¥ &H1000 Mod &H10

6-25 Temporary Input

No corresponding function.

6-26 Consecutive Line Drawing

No corresponding function.

6-27 Contents Display

No corresponding function.

6-28 Video Display

No corresponding function.

7 Other Important Points

This chapter provides the additional information you should know to convert NS screen data to NA screen data.

- The text size differs between Sysmac Studio and an NA unit

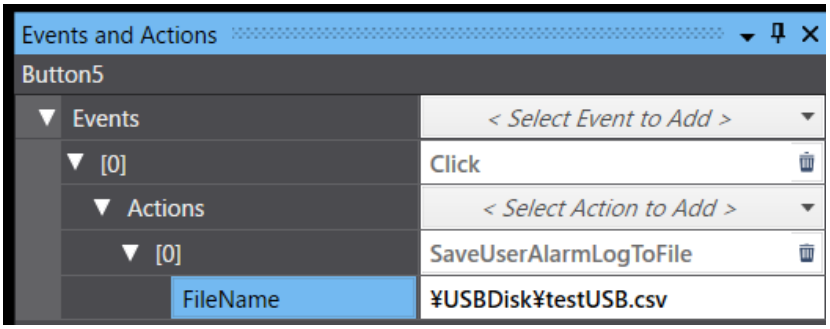
Segoe UI, the default of the text family, is an English font. Therefore, a Japanese or Chinese character may cause this issue.
Change the test family according to your language, following the table below.

Language	Recommended Font Family
Japanese	Meiryo, MS Gothic
Simplified Chinese	Microsoft YaHei, SimSun
Traditional Chinese	Microsoft JhengHei, MingLiU
Korean	Malgun Gothic, Gulim, GulimChe

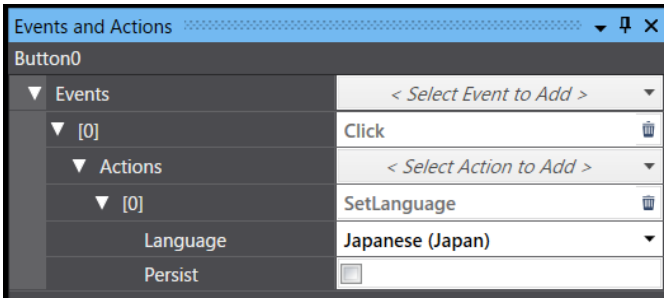
- How to specify a path to save the log file

The formats to specify a path to save the user alarm log are shown below.
A file name must include an extension.

Save to	Format
SD card	¥SDCard¥file name
USB stick memory	¥USBDisk¥file name



● Japanese Hiragana and Katakana cannot be input through a character keypad.
To enter Japanese, you need to select Japanese for the system language of NA.
If you use Korean, Simplified Chinese, or Traditional Chinese, select a corresponding system language.
Because the system language corresponds to a user language, changing the user language changes the system language.
Select **Events and Actions** - **SetLanguage** then select the language you want to set in the **Language** selection.



Default language	Language List		
	Project Languages	System Languages	Software Keypads
	English (United States)	English (United States)	Standard
	Japanese (Japan)	Japanese (Japan)	Standard
	Chinese (Simplified, PRC)	Chinese (Simplified)	Standard

8 Change Controller Program

There are differences in system functionalities and functional objects between NA series units and NS series units. Some of these differences can be resolved with VB programs, but some cannot be migrated to NA units due to performance or functional issues.
In those cases, you need to change programs in the controller.

8-1 Example of Changing Controller Program

To create a screen that monitors 200 channels at a time from addresses D1000 to D2999, use the index register, *i0*, to assign addresses to the numeral display objects as follows. The numeral display objects and host communication processing of NS units achieve monitoring with less load. Index register values range from 0 to 2700.

D1000*i0*	D1001*i0*	D1002*i0*	...	D1009*i0*
D1010*i0*	D1011*i0*	D1012*i0*	...	D1019*i0*
D1020*i0*	D1021*i0*	D1022*i0*	...	D1029*i0*
...	...	...	...	
D1190*i0*	D1191*i0*	D1192*i0*		D1199*i0*

To achieve this using an NA unit, you need to replace an assigned address with an array variable, and also, use VB for processing. In this example, define a numeric-type variable idx, which refers to the first channel, and an array numeric variable DD(200). Then, lay out a data display object assigning conditional expressions to the variables in the range of DDisp(0) to Ddisp(199).
Also, define an array type network variable Dmon(2000) to monitor a value in the PLC.
Direct assigning to the data display object, like Dmon(22+idx), would be the same manner as NS, but it is impossible. Therefore, copy the monitoring variables to the display variables by using a VB program.

Ddisp(0)	Ddisp(1)	Ddisp(2)	...	Ddisp(9)
Ddisp(10)	Ddisp(11)	Ddisp(12)	...	Ddisp(19)
Ddisp(20)	Ddisp(21)	Ddisp(22)	...	Ddisp(29)
...	...	...	...	
Ddisp(190)	Ddisp(191)	Ddisp(192)	...	Ddisp(199)

```
Sub Monitor_E_Mem
   Dim i as Integer
If _HMI_CurrentPageIndex <> page number of the monitor screen Then Exit Sub
   For i = 0 to 199
      DDisp(i) = DMon(idx + i)
   Next
End Sub
```

Select **Events** - **Interval** - **1 Second** in the global event to run this subroutine.
Because running this subroutine on screens other than the monitor screen does not make sense, use the system variable _HMI_CurrentPageIndex, which shows a currently displayed screen index, to prevent copying.

Now you can achieve the similar monitoring function as NS, but the subroutine has an issue: it may issue read commands for one channel per For loop. Usually, 1 to 10 read commands are required to get all the data in one screen. In this example, there are 200 loops, so the number of read

commands increases by 200. Therefore, the monitoring interval will extend 20 times or more. For instance, a screen that used to refresh every 0.2 seconds will refresh every 4 seconds.

To avoid this issue, copy the memory in the PLC, using the variables idx(DM200) and EDisp (200 channels from DM20000). It is not necessary to add VB functions and Events attributes to global events in the NA series.

[Sample ladder diagram]

$SB61	–	–	Unsupported	User variable	–	–	–	–	
$SB62	–	–	Unsupported	User variable	–	–	–	–	
$SB63	–	–	Unsupported	User variable	–	–	–	–	
$SW0	Current Screen No. (Screen is switched when it is changed)	R/W	VB	System variable	_HMI_CurrentPageIndex	Integer	Current Page Index	Specifies the page number of currently displayed page. While a pop-up screen is displayed, specifies the number of the pop-up. While a pop-up is displayed, writing the value to the memory displays a new pop-up. If a normal page is displayed, the page switches. If the value is the number of a non-existent page, the memory gets the previous value. Because NS system memory's data size is 1-word but NA system variable's size is 2-word, data size conversion is required.	R/W
$SW1	Current Pop-up Screen 1 Number	R/W	VB *1						R/W
$SW2	Position of Pop-up Screen 1 (Top left X coordinate)	R/W	Unsupported	User variable	–	–	–	–	
$SW3	Position of Pop-up Screen 1 (Top left Y coordinate)	R/W	Unsupported	User variable	–	–	–	–	
$SW4	Current Pop-up Screen 2 Number	R/W	Unsupported	User variable	–	–	–	–	
$SW5	Position of Pop-up Screen 2 (Top left X coordinate)	R/W	Unsupported	User variable	–	–	–	–	

*1: A modification may be required in the PLC.

System Memory **System Variables/ User Variables**

CX-Designer			Sysmac Studio

System Memory **System Variables/ User Variables**

CX-Designer			Sysmac Studio						
Address	Description	R/W	Supported by:	Variable Type	Variable Name	Data type	Variable Represents:	Description	R/W
$SW39	Authentication Level	R	VB	System variable	_HMI_CurrentUserRole	String	The right of a user	Shows the right of a user currently logging in.	R
$SW40	Range for Initializing Alarm/ Event History	R/W (Ext Control)	Unsupported	User variable	–	–	–	–	

How to Replace	
To realize the NS system memory in NA, PLC program modification will be required in many cases.	
Supported	The NA system variable works equally with the NS system memory without a PLC program modification.
Variable mapping	The NA system variable works equally with the NS system memory without a PLC program modification.
VB	Using a subroutine can perform the same function as NS.
Unsupported	No corresponding function is available in NA.

Variable Type	
User variable	Define user variables, PTMEM_SB# and PTMEM_SW#, which assigned to addresses.

◆**Command Button_DB**

Command Button: DB Control **Button**

CX-Designer	Sysmac Studio		
Function	Event	Action	VB Function
Read data from CSV file to PLC Data Block	Press	Subroutine	WriteReicipeToController
Write data from PLC Data Block to CSV file			ReadReicipeToController
Read data from CSV file to NS PT Memory			ImportReicipes
Write data from NS PT Memory to CSV file			SaveReicipe
Read data from NS PT Memory to PLC Data Block			WriteReicipeToController
Write data from PLC Data Block to NS PT Memory			ReadReicipeToController
Read record label			GetReicipeName
Delete record			DeleteReicipe

The NS functions seem to be substituted by VB functions. However, since the Recipe feature of NA differs from the Data Block feature of NS, some NS functions may not be available in NA.
